# Data Collector Reference - Infrastructure

## Vendor-Specific Reference

The topics in this section provide vendor-specific reference information. In most cases, configuring a data collector is straightforward. In some cases, you may need additional information or commands to properly configure the data collector.

Click on a **vendor** in the menu to the left to see information for their data collectors.

## Configuring the Amazon EC2 data collector

Cloud Insights uses the Amazon EC2 data collector to acquire inventory and performance data from EC2 instances.

### Requirements

In order to collect data from Amazon EC2 devices, you must have the following information:

- You must have one of the following:
  - The **IAM Role** for your Amazon EC2 cloud account, if using IAM Role Authentication. IAM Role only applies if your acquisition unit is installed on an AWS instance.
  - The **IAM Access Key** ID and Secret Access Key for your Amazon EC2 cloud account, if using IAM Access Key authentication.
- You must have the "list organization" privilege
- Port 443 HTTPS
- EC2 Instances can be reported as a Virtual Machine, or (less naturally) a Host. EBS Volumes can be reported as both a VirtualDisk used by the VM, as well as a DataStore providing the Capacity for the VirtualDisk.

Access keys consist of an access key ID (for example, AKIAIOSFODNN7EXAMPLE) and a secret access key (for example, wJalrXUtnFEMI/K7MDENG/bPxrFcYEXAMPLEKEY). You use access keys to sign programmatic requests that you make to EC2 if you use the Amazon EC2 SDKs, REST, or Query API operations. These keys are provided with your contract from Amazon.

### Configuration

Enter data into the data collector fields according to the table below:

| Field                 | Description                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------|
| AWS Region            | Choose AWS region                                                                                         |
| IAM Role              | For use only when acquired on an AU in AWS. See below for more information on <a href="#">IAM Roles</a> . |
| AWS IAM Access Key ID | Enter AWS IAM Access Key ID. Required if you do not use IAM Role.                                         |

| Field                                      | Description                                                                                                 |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| AWS IAM Secret Access Key                  | Enter AWS IAM Secret Access Key. Required if you do not use IAM Role.                                       |
| I understand AWS bills me for API requests | Check this to verify your understanding that AWS bills you for API requests made by Cloud Insights polling. |

## Advanced Configuration

| Field                                                        | Description                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Include Extra Regions                                        | Specify additional regions to include in polling.                                                                                                                                                                                                                                                 |
| Cross Account Role                                           | Role for accessing resources in different AWS accounts.                                                                                                                                                                                                                                           |
| Inventory Poll Interval (min)                                | The default is 60                                                                                                                                                                                                                                                                                 |
| Choose 'Exclude' or 'Include' to Apply to Filter VMs by Tags | Specify whether to include or exclude VM's by Tags when collecting data. If 'Include' is selected, the Tag Key field can not be empty.                                                                                                                                                            |
| Tag Keys and Values on which to Filter VMs                   | Click <b>+ Filter Tag</b> to choose which VMs (and associated disks) to include/exclude by filtering for keys and values that match keys and values of tags on the VM. Tag Key is required, Tag Value is optional. When Tag Value is empty, the VM is filtered as long as it matches the Tag Key. |
| Performance Poll Interval (sec)                              | The default is 1800                                                                                                                                                                                                                                                                               |
| CloudWatch Agent Metrics Namespace                           | Namespace in EC2/EBS from which to collect data. Note that if the names of the default metrics in this namespace are changed, Cloud Insights may not be able to collect that renamed data. It is recommended to leave the default metric names.                                                   |

## IAM Access Key

Access keys are long-term credentials for an IAM user or the AWS account root user. Access keys are used to sign programmatic requests to the AWS CLI or AWS API (directly or using the AWS SDK).

Access keys consist of two parts: an access key ID and a secret access key. When you use *IAM Access Key* authentication (as opposed to *IAM Role* authentication), you must use both the access key ID and secret access key together for authentication of requests. For more information, see the Amazon documentation on [Access Keys](#).

## IAM Role

When using *IAM Role* authentication (as opposed to *IAM Access Key* authentication), you must ensure that the role you create or specify has the appropriate permissions needed to access your resources.

For example, if you create an IAM role named *InstanceEc2ReadOnly*, you must set up the policy to grant EC2 read-only list access permission to all EC2 resources for this IAM role. Additionally, you must grant STS (Security Token Service) access so that this role is allowed to assume roles cross accounts.

After you create an IAM role, you can attach it when you create a new EC2 instance or any existing EC2 instance.

After you attach the IAM role *InstanceEc2ReadOnly* to an EC2 instance, you will be able to retrieve the temporary credential through instance metadata by IAM role name and use it to access AWS resources by any application running on this EC2 instance.

For more information see the Amazon documentaiton on [IAM Roles](#).

Note: IAM role can be used only when the Acquisition Unit is running in an AWS instance.

## Mapping Amazon tags to Cloud Insights annotations

The Amazon EC2 data collector includes an option that allows you to populate Cloud Insights annotations with tags configured on EC2. The annotations must be named exactly as the EC2 tags. Cloud Insights will always populate same-named text-type annotations, and will make a "best attempt" to populate annotations of other types (number, boolean, etc). If your annotation is of a different type and the data collector fails to populate it, it may be necessary to remove the annotation and re-create it as a text type.

Note that AWS is case-sensitive, while Cloud Insights is case-insensitive. So if you create an annotation named "OWNER" in Cloud Insights, and tags named "OWNER", "Owner", and "owner" in EC2, all of the EC2 variations of "owner" will map to Cloud Insight's "OWNER" annotation.

## Include Extra Regions

In the AWS Data Collector **Advanced Configuration** section, you can set the **Include extra regions** field to include additional regions, separated by comma or semi-colon. By default, this field is set to *us-.\**, which collects on all US AWS regions. To collect on *all* regions, set this field to *.\**.

If the **Include extra regions** field is empty, the data collector will collect on assets specified in the **AWS Region** field as specified in the **Configuration** section.

## Collecting from AWS Child Accounts

Cloud Insights supports collection of child accounts for AWS within a single AWS data collector. Configuration for this collection is performed in the AWS environment:

- You must configure each child account to have an AWS Role that allows the main account ID to access EC2 details from the children account.
- Each child account must have the role name configured as the same string.
- Enter this role name string into the Cloud Insights AWS Data Collector **Advanced Configuration** section, in the **Cross account role** field.

Best Practice: It is highly recommended to assign the AWS predefined *AmazonEC2ReadOnlyAccess* policy to the EC2 main account. Also, the user configured in the data source should have at least the predefined *AWSOrganizationsReadOnlyAccess* policy assigned, in order to query AWS.

Please see the following for information on configuring your environment to allow Cloud Insights to collect from AWS child accounts:

[Tutorial: Delegate Access Across AWS Accounts Using IAM Roles](#)

[AWS Setup: Providing Access to an IAM User in Another AWS Account That You Own](#)

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Amazon FSx for NetApp ONTAP data collector

This data collector acquires inventory and performance data from Amazon FSx for NetApp ONTAP. This data collector will be made available incrementally throughout the Cloud Insights service regions. Contact your sales person if you do not see the Icon for this collector in your Cloud Insights Environment.

## Terminology

Cloud Insights acquires inventory and performance data from the FSx-NetApp data collector. For each asset type acquired, the most common terminology used for the asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Cluster           | Storage             |
| LUN               | Volume              |
| Volume            | Internal Volume     |

## FSx-NetApp Terminology

The following terms apply to objects or references that you might find on FSx-NetApp storage asset landing pages. Many of these terms apply to other data collectors as well.

### Storage

- Model – A comma-delimited list of the unique, discrete model names within this cluster.
- Vendor – AWS
- Serial number – The array serial number.
- IP – generally will be the IP(s) or hostname(s) as configured in the data source.
- Raw Capacity – base 2 summation of all the SSD storage assigned to the FSx filesystem.
- Latency – a representation of what the host facing workloads are experiencing, across both reads and writes. Ideally, Cloud Insights is sourcing this value directly, but this is often not the case. In lieu of the array offering this up, Cloud Insights is generally performing an IOPs-weighted calculation derived from the individual internal volumes' statistics.
- Throughput – aggregated from internal volumes.  
Management – this may contain a hyperlink for the management interface of the device. Created programmatically by the Cloud Insights data source as part of inventory reporting.

## Storage Pool

- Storage – what storage array this pool lives on. Mandatory.
- Type – a descriptive value from a list of an enumerated list of possibilities. Most commonly will be “Aggregate” or “RAID Group”.
- Capacity – the values here are the logical used, usable capacity and the logical total capacity, and the percentage used across these.
- IOPS – the sum IOPs of all the volumes allocated on this storage pool.
- Throughput – the sum throughput of all the volumes allocated on this storage pool.

## Requirements

The following are requirements to configure and use this data collector:

- You must have access to an Administrator account configured for read-only API calls.
- Account details include username and password.
- Port requirements: 80 or 443

## Configuration

| Field                | Description                                                     |
|----------------------|-----------------------------------------------------------------|
| NetApp Management IP | IP address or fully-qualified domain name of the NetApp cluster |
| User Name            | User name for NetApp cluster                                    |
| Password             | Password for NetApp cluster                                     |

## Advanced Metrics

This data collector collects the following advanced metrics from the FSx for NetApp ONTAP storage:

- fpolicy
- nfsv3
- nfsv3:node
- nfsv4
- nfsv4\_1
- nfsv4\_1:node
- nfsv4:node
- policy\_group
- qtree
- volume
- workload\_volume

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                                                                                                                                                                                                                                                   | Try this:                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Receive 401 HTTP response or 13003 ZAPI error code and ZAPI returns "Insufficient privileges" or "not authorized for this command"                                                                                                                                                                                                         | Check username and password, and user privileges/permissions.                                                                                                           |
| ZAPI returns "cluster role is not cluster_mgmt LIF"                                                                                                                                                                                                                                                                                        | AU needs to talk to cluster management IP. Check the IP and change to a different IP if necessary                                                                       |
| ZAPI command fails after retry                                                                                                                                                                                                                                                                                                             | AU has communication problem with the cluster. Check network, port number, and IP address. User should also try to run a command from command line from the AU machine. |
| AU failed to connect to ZAPI via HTTP                                                                                                                                                                                                                                                                                                      | Check whether ZAPI port accepts plaintext. If AU tries to send plaintext to an SSL socket, the communication fails.                                                     |

## Configuring the Azure compute data collector

Cloud Insights uses the Azure compute data collector to acquire inventory and performance data from Azure compute instances.

### Requirements

You need the following information to configure this data collector.

- Port requirement: 443 HTTPS

- Azure OAuth 2.0 Redirect URI (login.microsoftonline.com)
- Azure Management Rest IP (management.azure.com)
- Azure Resource Manager IP (management.core.windows.net)
- Azure Service Principal Application (Client) ID (Reader role required)
- Azure service principal authentication key (user password)
- You need to set up an Azure account for Cloud Insights discovery.

Once the account is properly configured and you register the application in Azure, you will have the credentials required to discover the Azure instance with Cloud Insights. The following link describes how to set up the account for discovery.

<https://docs.microsoft.com/en-us/azure/active-directory/develop/howto-create-service-principal-portal>

## Configuration

Enter data into the data collector fields according to the table below:

| Field                                                                  | Description                                                                                                |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Azure Service Principal Application (Client) ID (Reader role required) | Sign-in ID to Azure. Requires Reader Role access.                                                          |
| Azure tenant ID                                                        | Microsoft tenant ID                                                                                        |
| Azure Service Principal Authentication Key                             | Login authentication key                                                                                   |
| I understand Microsoft bills me for API requests                       | Check this to verify your understanding that Microsoft bills you for API requests made by Insight polling. |

## Advanced Configuration

| Field                                                        | Description                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inventory Poll Interval (min)                                | The default is 60                                                                                                                                                                                                                                                                                 |
| Choose 'Exclude' or 'Include' to Apply to Filter VMs by Tags | Specify whether to include or exclude VM's by Tags when collecting data. If 'Include' is selected, the Tag Key field can not be empty.                                                                                                                                                            |
| Tag Keys and Values on which to Filter VMs                   | Click <b>+ Filter Tag</b> to choose which VMs (and associated disks) to include/exclude by filtering for keys and values that match keys and values of tags on the VM. Tag Key is required, Tag Value is optional. When Tag Value is empty, the VM is filtered as long as it matches the Tag Key. |
| Performance Poll Interval (sec)                              | The default is 300                                                                                                                                                                                                                                                                                |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

# Broadcom

## Brocade Network Advisor data collector

Cloud Insights uses the Brocade Network Advisor data collector to acquire inventory and performance data from Brocade switches.

### Terminology

Cloud Insights acquires the following inventory information from the Brocade Network Advisor data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term               | Cloud Insights Term |
|---------------------------------|---------------------|
| Switch                          | Switch              |
| Port                            | Port                |
| Virtual Fabric, Physical Fabric | Fabric              |
| Logical Switch                  | Logical Switch      |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

The following are required to configure this data collector:

- The Cloud Insights Acquisition Unit will initiate connections to TCP port 443 on the BNA server. BNA server must be running version 14.2.1 or higher.
- Brocade Network Advisor Server IP address
- User name and password to an administrator account
- Port requirement: HTTP/HTTPS 443

### Configuration

| Field                             | Description                              |
|-----------------------------------|------------------------------------------|
| Brocade Network Advisor Server IP | IP address of the Network Advisor Server |
| User Name                         | User name for the switch                 |
| User Name                         | Administrator user name                  |
| Password                          | Administrator password                   |

### Advanced configuration

| Field           | Description                                        |
|-----------------|----------------------------------------------------|
| Connection Type | HTTPS (default port 443) or HTTP (default port 80) |

| Field                           | Description                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------|
| Override Connection Port        | If blank, use the default port in the Connection Type field, otherwise enter the connection port to use |
| Password                        | Password for the switch                                                                                 |
| Inventory poll interval (min)   | The default is 40                                                                                       |
| Report Access Gateway           | Check to include devices in Access Gateway mode                                                         |
| Performance Poll Interval (sec) | The default is 1800                                                                                     |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                                                   | Try this:                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Receive a message that more than 1 node is logged into the Access Gateway port, or data collector fails to discover Access Gateway device. | Check that the NPV device is operating correctly and that all connected WWNs are expected. Do not directly acquire the NPV device. Instead, acquisition of the core fabric switch will collect the NPV device data. |

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Brocade FC Switch data collector

Cloud Insights uses the Brocade FC Switch (SSH) data source to discover inventory for Brocade or rebranded switch devices running Factored Operating System (FOS) firmware 4.2 and later. Devices in both FC switch and Access Gateway modes are supported.

### Terminology

Cloud Insights acquires the following inventory information from the Brocade FC Switch data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term               | Cloud Insights Term |
|---------------------------------|---------------------|
| Switch                          | Switch              |
| Port                            | Port                |
| Virtual Fabric, Physical Fabric | Fabric              |
| Zone                            | Zone                |
| Logical Switch                  | Logical Switch      |
| Virtual Volume                  | Volume              |
| LSAN Zone                       | IVR Zone            |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- The Cloud Insights Acquisition Unit (AU) will initiate connections to TCP Port 22 on Brocade switches to collect inventory data. The AU will also initiate connections to UDP port 161 for collection of performance data.
- There must be IP connectivity to all switches in the fabric. If you select the Discover all switches in the fabric check box, Cloud Insights identifies all the switches in the fabric; however, it needs IP connectivity to these additional switches to discover them.
- The same account is needed globally across all switches in the fabric. You can use PuTTY (open source terminal emulator) to confirm access.
- Ports 161 and 162 must be open to all switches in the fabric for SNMP performance polling.
- SNMP read-only Community String

## Configuration

| Field                 | Description                                                 |
|-----------------------|-------------------------------------------------------------|
| Switch IP             | IP address or fully-qualified domain name of the EFC Server |
| User Name             | User name for the switch                                    |
| Password              | Password for the switch                                     |
| SNMP                  | SNMP version                                                |
| SNMP Community String | SNMP read-only community string used to access the switch   |
| SNMP User Name        | SNMP user name                                              |
| SNMP Password         | SNMP password                                               |

## Advanced configuration

| Field                         | Description                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Fabric name                   | Fabric name to be reported by the data collector. Leave blank to report the fabric name as WWN.                                       |
| Inventory Poll Interval (min) | Interval between inventory polls. The default is 15.                                                                                  |
| Excluded Devices              | Comma-separated list of device IDs to exclude from polling                                                                            |
| Admin Domains Active          | Select if using Admin Domains                                                                                                         |
| Retrieve MPR Data             | Select to acquire routing data from your multiprotocol router.                                                                        |
| Enable Trapping               | Select to enable acquisition upon receiving an SNMP trap from the device. If you select enable trapping, you must also activate SNMP. |

| Field                                | Description                                                                      |
|--------------------------------------|----------------------------------------------------------------------------------|
| Minimum Time Between Traps (sec)     | Minimum time between acquisition attempts triggered by traps. The default is 10. |
| Discover all switches in the fabric  | Select to discover all switches in the fabric                                    |
| Choose Favoring HBA vs. Zone Aliases | Choose whether to favor HBA or zone aliases                                      |
| Performance Poll Interval (sec)      | Interval between performance polls. The default is 300.                          |
| SNMP Auth Protocol                   | SNMP authentication protocol (SNMP v3 only)                                      |
| SNMP Privacy Password                | SNMP privacy password (SNMP v3 only)                                             |
| SNMP Retries                         | Number of SNMP retry attempts                                                    |

## Troubleshooting

Error detecting prompt)</pre> | <p>The issue may be caused when the Brocade switch takes too long to return with a prompt, exceeding the default timeout of 5 seconds.</p> <p>In the data collector's Advanced Configuration settings in Cloud Insights, try increasing the <i>SSH Banner Wait Timeout (sec)</i> to a higher value.</p> |
| Error: "Cloud Insights received Invalid Chassis Role"                                                                                                                                                                                                                                                                                                                                                                                               | Check that the user configured in this data source has been granted the chassis role permission.                                                                                                                                                                                                        |
| Error: "Mismatched Chassis IP Address"                                                                                                                                                                                                                                                                                                                                                                                                              | Change the data source configuration to use chassis IP address.                                                                                                                                                                                                                                         |
| Receive a message that more than 1 node is logged into the Access Gateway port                                                                                                                                                                                                                                                                                                                                                                      | Check that the NPV device is operating correctly and that all connected WWNs are expected. Do not directly acquire the NPV device. Instead, acquisition of the core fabric switch will collect the NPV device data.                                                                                     |

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Cisco MDS Fabric Switches data collector

Cloud Insights uses the Cisco MDS Fabric Switches data collector to discover inventory for Cisco MDS Fabric Switches as well as a variety of Cisco Nexus FCoE switches on which the FC service is enabled.

Additionally, you can discover many models of Cisco devices running in NPV mode with this data collector.

## Terminology

Cloud Insights acquires the following inventory information from the Cisco FC Switch data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term             | Cloud Insights Term |
|-------------------------------|---------------------|
| Switch                        | Switch              |
| Port                          | Port                |
| VSAN                          | Fabric              |
| Zone                          | Zone                |
| Logical Switch                | Logical Switch      |
| Name Server Entry             | Name Server Entry   |
| Inter-VSAN Routing (IVR) Zone | IVR Zone            |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- An IP address of one switch in the fabric or individual switches
- Chassis discovery, to enable fabric discovery
- If using SNMP V2, read-only community string
- Port 161 is used to access the device

## Configuration

| Field                 | Description                                                                            |
|-----------------------|----------------------------------------------------------------------------------------|
| Cisco Switch IP       | IP address or fully-qualified domain name of the switch                                |
| SNMP Version          | Select V1, V2, or V3. V2 or later is required for performance acquisition.             |
| SNMP Community String | SNMP read-only community string used to access the switch (not applicable for SNMP v3) |
| User Name             | User name for the switch (SNMP v3 only)                                                |
| Password              | Password used for the switch (SNMPv3 only)                                             |

## Advanced configuration

| Field                         | Description                                           |
|-------------------------------|-------------------------------------------------------|
| Inventory Poll Interval (min) | Interval between inventory polls (default 40 minutes) |

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNMP Auth Protocol               | SNMP authentication protocol (SNMPv3 only)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SNMP Privacy Protocol            | SNMP privacy protocol (SNMPv3 only)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SNMP Privacy Password            | SNMP Privacy Password                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SNMP Retries                     | Number of SNMP retry attempts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SNMP Timeout (ms)                | SNMP timeout (default 5000 ms)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Trapping                  | Select to enable trapping. If you enable trapping, you must also activate SNMP notifications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Minimum Time Between Traps (sec) | Minimum time between acquisition attempts triggered by traps (default 10 seconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Discover All Fabric Switches     | Select to discover all switches in the fabric                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Excluded Devices                 | Comma-separated list of device IPs to exclude from polling                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Included Devices                 | Comma-separated list of device IPs to include in polling                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check Device Type                | Select to accept only those devices that explicitly advertise themselves as Cisco devices                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| First Alias Type                 | <p>Provide a first preference for resolution of the alias. Choose from the following:</p> <p><b>Device Alais</b><br/>This is a user-friendly name for a port WWN (pWWN) that can be used in all configuration commands, as required. All switches in the Cisco MDS 9000 Family support Distributed Device Alias Services (device aliases).</p> <p><b>None</b><br/>Do not report any alias.</p> <p><b>Port Description</b><br/>A description to help identify the port in a list of ports.</p> <p><b>Zone Alias (all)</b><br/>A user-friendly name for a port that can be used only for the active configuration. This is the default.</p> |
| Second Alias Type                | Provide a second preference for resolution of the alias                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Third Alias Type                 | Provide a third preference for resolution of the alias                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Enable SANTap Proxy Mode Support | Select if your Cisco switch is using SANTap in proxy mode. If you are using EMC RecoverPoint, then you are probably using SANTap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Performance Poll Interval (sec)  | Interval between performance polls (default 300 seconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                             | Try this:                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error: Failed to discover chassis - no switches have been discovered | <ul style="list-style-type: none"><li>• Ping the device with the IP configured</li><li>• Login to the device using Cisco Device Manager GUI</li><li>• Login to the device using CLI</li><li>• Try to run SNMP walk</li></ul>                                                          |
| Error: Device is not a Cisco MDS switch                              | <ul style="list-style-type: none"><li>• Make sure the data source IP configured for the device is correct</li><li>• Login to the device using Cisco Device Manager GUI</li><li>• Login to the device using CLI</li></ul>                                                              |
| Error: Cloud Insights is not able to obtain the switch's WWN.        | This may not be a FC or FCoE switch, and as such may not be supported. Make sure the IP/FQDN configured in the datasource is truly a FC/FCoE switch.                                                                                                                                  |
| Error: Found more than one nodes logged into NPV switch port         | Disable direct acquisition of the NPV switch                                                                                                                                                                                                                                          |
| Error: Could not connect to the switch                               | <ul style="list-style-type: none"><li>• Make sure the device is UP</li><li>• Check the IP address and listening port</li><li>• Ping the device</li><li>• Login to the device using Cisco Device Manager GUI</li><li>• Login to the device using CLI</li><li>• Run SNMP walk</li></ul> |

### Performance

| Problem:                                                | Try this:                                                                                                                                                                        |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error: Performance acquisition not supported by SNMP v1 | <ul style="list-style-type: none"><li>• Edit Data Source and disable Switch Performance</li><li>• Modify Data Source and switch configuration to use SNMP v2 or higher</li></ul> |

## Cohesity SmartFiles data collector

This REST API-based collector will acquire a Cohesity cluster, discovering the “Views” (as Cloud Insights Internal Volumes), the various nodes, as well as collecting performance metrics.

### Configuration

| Field               | Description                        |
|---------------------|------------------------------------|
| Cohesity Cluster IP | IP address of the Cohesity cluster |

| Field     | Description                            |
|-----------|----------------------------------------|
| User Name | User name for the Cohesity cluster     |
| Password  | Password used for the Cohesity cluster |

## Advanced configuration

| Field                           | Description                                                     |
|---------------------------------|-----------------------------------------------------------------|
| TCP Port                        | Port used for TCP communication with the Cohesity cluster       |
| Inventory Poll Interval (min)   | Interval between inventory polls. The default is 60 minutes.    |
| Performance Poll Interval (min) | Interval between performance polls. The default is 900 seconds. |

## Troubleshooting

# Dell

## Dell EMC XC Series data collector

Cloud Insights uses this data collector to discover inventory and performance information for the Dell EMC XC Series storage arrays.

### Configuration

| Field                     | Description                     |
|---------------------------|---------------------------------|
| Prism External IP Address | IP address of the XC server     |
| User Name                 | User name for the XC server     |
| Password                  | Password used for the XC server |

### Advanced configuration

| Field                           | Description                                                     |
|---------------------------------|-----------------------------------------------------------------|
| TCP Port                        | Port used for TCP communication with the XC server              |
| Inventory Poll Interval (min)   | Interval between inventory polls. The default is 60 minutes.    |
| Performance Poll Interval (min) | Interval between performance polls. The default is 300 seconds. |

## Troubleshooting

# Dell EMC

## DELL EMC Data Domain data collector

This data collector gathers inventory and performance information from DELL EMC Data Domain deduplication storage systems. To configure this data collector, there are specific configuration instructions and usage recommendations you must follow.

### Terminology

Cloud Insights acquires the following inventory information from the Data Domain data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term  | Cloud Insights Term |
|--------------------|---------------------|
| Disk               | Disk                |
| Array              | Storage             |
| FC Port            | Port                |
| File System        | Internal Volume     |
| Quota              | Quota               |
| NFS and CIFS share | FileShare           |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

You need the following information to configure this data collector:

- IP address of the Data Domain device
- Read-only user name and password to the Data Domain storage
- SSH port 22

### Configuration

| Field      | Description                                                                    |
|------------|--------------------------------------------------------------------------------|
| IP address | The IP address or fully-qualified domain name of the Data Domain storage array |
| User name  | The user name for the Data Domain storage array                                |
| Password   | The password for the Data Domain storage array                                 |

## Advanced configuration

| Field                         | Description                                          |
|-------------------------------|------------------------------------------------------|
| Inventory Poll Interval (min) | Interval between inventory polls. The default is 20. |
| SSH Port                      | SSH service port                                     |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Configuring the EMC ECS data collector

This data collector acquires inventory and performance data from EMC ECS storage systems. For configuration, the data collector requires an IP address of the ECS server and an administrative level domain account.

Dell EMC ECS is metered at a different Raw TB to Managed Unit rate. Every 40 TB of unformatted ECS capacity is charged as 1 [Managed Unit \(MU\)](#).

## Terminology

Cloud Insights acquires the following inventory information from the ECS data collector. For each asset type acquired, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Cluster           | Storage             |
| Tenant            | Storage Pool        |
| Bucket            | Internal Volume     |
| Disk              | Disk                |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- An IP address of the ECS Management Console
- Administrative level domain account for the ECS system
- Port 443 (HTTPS). Requires outbound connectivity to TCP port 443 on the ECS system.
- For performance, read-only username and password for ssh/scp access.
- For performance, port 22 is required.

## Configuration

| Field         | Description                                                 |
|---------------|-------------------------------------------------------------|
| ECS Host      | IP address or fully-qualified domain name of the ECS system |
| ECS Host Port | Port used for communication with ECS Host                   |
| ECS Vendor ID | Vendor ID for ECS                                           |
| Password      | Password used for ECS                                       |

### Advanced configuration

| Field                         | Description                 |
|-------------------------------|-----------------------------|
| Inventory Poll Interval (min) | The default is 360 minutes. |

### Troubleshooting

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Dell EMC PowerScale data collector

Cloud Insights uses the Dell EMC PowerScale (previously Isilon) SSH data collector to acquire inventory and performance data from PowerScale scale-out NAS storage.

### Terminology

Cloud Insights acquires the following inventory information from this data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Drive             | Disk                |
| Cluster           | Storage             |
| Node              | Storage Node        |
| File System       | Internal Volume     |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

You need the following information to configure this data collector:

- Administrator permissions to the PowerScale storage
- IP address of the PowerScale cluster
- SSH access to port 22

## Configuration

| Field      | Description                                                             |
|------------|-------------------------------------------------------------------------|
| IP address | The IP address or fully-qualified domain name of the PowerScale cluster |
| User Name  | User name for the PowerScale cluster                                    |
| Password   | Password used for the PowerScale cluster                                |

## Advanced configuration

| Field                           | Description                                             |
|---------------------------------|---------------------------------------------------------|
| Inventory Poll Interval (min)   | Interval between inventory polls. The default is 20.    |
| Performance Poll Interval (sec) | Interval between performance polls. The default is 300. |
| SSH Port                        | SSH service port. The default is 22.                    |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                                                               | Try this:                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| "Invalid login credentials" with error messages "Commands not enabled for role-based administration require root user access"                          | <ul style="list-style-type: none"><li>* Verify that the user has permissions to run the following commands on the device:<ul style="list-style-type: none"><li>&gt; isi version osrelease</li><li>&gt; isi status -q</li><li>&gt; isi status -n</li><li>&gt; isi devices -d %s</li><li>&gt; isi license</li></ul></li><li>* Verify credentials used in the wizard are matching device credentials</li></ul> |
| "Internal Error" with error messages "Command <Your command> run failed with permission: <Your current permission>. Sudo command run permission issue" | Verify that the user has sudo permissions to run the following command on the device                                                                                                                                                                                                                                                                                                                        |

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Dell EMC PowerStore data collector

The EMC PowerStore data collector gathers inventory information from EMC PowerStore storage. For configuration, the data collector requires the IP address of the storage processors and a read-only user name and password.

The EMC PowerStore data collector gathers the volume-to-volume replication relationships that PowerStore coordinates across other storage arrays. Cloud Insights shows a storage array for each PowerStore cluster, and collects inventory data for nodes and storage ports on that cluster. No storage pool or volume data is

collected.

## Terminology

Cloud Insights acquires the following inventory information from this data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term                                                | Cloud Insights Term |
|------------------------------------------------------------------|---------------------|
| host                                                             | host                |
| host_volume_mapping                                              | host_volume_mapping |
| hardware (it has Drives under "extra_details" object):<br>Drives | Disk                |
| Appliance                                                        | StoragePool         |
| Cluster                                                          | Storage Array       |
| Node                                                             | StorageNode         |
| fc_port                                                          | Port                |
| volume                                                           | Volume              |
| InternalVolume                                                   | file_system         |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

The following information is required to configure this data collector:

- IP address or fully-qualified domain name of storage processor
- Read-only user name and password

## Configuration

| Field                 | Description                                                        |
|-----------------------|--------------------------------------------------------------------|
| PowerStore gateway(s) | IP addresses or fully-qualified domain names of PowerStore storage |
| User Name             | User name for PowerStore                                           |
| Password              | Password used for PowerStore                                       |

## Advanced configuration

| Field                             | Description                                                  |
|-----------------------------------|--------------------------------------------------------------|
| HTTPS Port                        | Default is 443                                               |
| Inventory Poll Interval (minutes) | Interval between inventory polls. The default is 60 minutes. |

Cloud Insight's PowerStore performance collection makes use of PowerStore's 5-minute granularity source data. As such, Cloud Insights polls for that data every five minutes, and this is not configurable.

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Dell EMC RecoverPoint data collector

The EMC RecoverPoint data collector's primary use case is to discover volume-to-volume replication relationships that the RecoverPoint storage appliance facilitates. This collector will also discover the Recoverpoint appliance itself. Please note that Dell/EMC sells a VMware backup solution for VMs--"RecoverPoint for VMs"--which is not supported by this collector

For configuration, the data collector requires the IP address of the storage processors and a read-only user name and password.

The EMC RecoverPoint data collector gathers the volume-to-volume replication relationships that RecoverPoint coordinates across other storage arrays. Cloud Insights shows a storage array for each RecoverPoint cluster, and collects inventory data for nodes and storage ports on that cluster. No storage pool or volume data is collected.

## Requirements

The following information is required to configure this data collector:

- IP address or fully-qualified domain name of storage processor
- Read-only user name and password
- REST API access via port 443

## Configuration

| Field                   | Description                                                       |
|-------------------------|-------------------------------------------------------------------|
| Address of RecoverPoint | IP address or fully-qualified domain name of RecoverPoint cluster |
| User Name               | User name for the RecoverPoint cluster                            |
| Password                | Password used for the RecoverPoint cluster                        |

## Advanced configuration

| Field                             | Description                                                  |
|-----------------------------------|--------------------------------------------------------------|
| TCP Port                          | TCP Port used to connect to Recoverpoint cluster             |
| Inventory Poll Interval (minutes) | Interval between inventory polls. The default is 20 minutes. |

| Field             | Description                                                           |
|-------------------|-----------------------------------------------------------------------|
| Excluded Clusters | Comma-separated list of cluster IDs or names to exclude when polling. |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## DELL EMC ScaleIO data collector

The ScaleIO data collector collects inventory information from ScaleIO storage. For configuration, this data collector requires the ScaleIO gateway address and an admin user name and password.

## Terminology

Cloud Insights acquires the following inventory information from the ScaleIO data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term               | Cloud Insights Term |
|---------------------------------|---------------------|
| MDM (Meta Data Manager) Cluster | Storage             |
| SDS (ScaleIO Data Server)       | Storage Node        |
| Storage Pool                    | Storage Pool        |
| Volume                          | Volume              |
| Device                          | Disk                |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- Read-only access to the Admin user account
- Port requirement: HTTPS Port 443

## Configuration

| Field              | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| ScaleIO Gateway(s) | IP addresses or FQDNs of ScaleIO gateways, separated by comma (,) or semicolon (;) |
| User Name          | Admin user name used to log in to the ScaleIO device                               |
| Password           | Password used to log in to the ScaleIO device                                      |

## Advanced configuration

Click the Inventory check box to enable inventory collection.

| Field                         | Description        |
|-------------------------------|--------------------|
| HTTPS port                    | 443                |
| Inventory poll interval (min) | The default is 60. |
| Connection Timeout (sec)      | The default is 60. |

## Troubleshooting

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Configuring the EMC Unity data collector

The DELL EMC Unity (formerly VNXe) data collector provides inventory support for VNXe unified storage arrays. Cloud Insights currently supports iSCSI and NAS protocols.

### Requirements

- The Unity data collector is CLI based; you must install the Unisphere for Unity CLI, (uemcli.exe) onto the acquisition unit where your VNXe data collector resides.
- uemcli.exe uses HTTPS as the transport protocol, so the acquisition unit will need to be able to initiate HTTPS connections to the Unity.
- IP address or fully-qualified domain name of the Unity device
- You must have at least a read-only user for use by the data collector.
- HTTPS on Port 443 is required
- The EMC Unity data collector provides NAS and iSCSI support for inventory; fibre channel volumes will be discovered, but Cloud Insights does not report on FC mapping, masking, or storage ports.

### Terminology

Cloud Insights acquires the following inventory information from the Unity data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term                     | Cloud Insights Term |
|---------------------------------------|---------------------|
| Disk                                  | Disk                |
| Storage Array                         | Storage             |
| Processor                             | Storage Node        |
| Storage Pool                          | Storage Pool        |
| General iSCSI Block info, VMWare VMFS | Share               |
| Replication Remote System             | Synchronization     |
| iSCSI Node                            | iSCSI Target Node   |

| Vendor/Model Term | Cloud Insights Term    |
|-------------------|------------------------|
| iSCSI Initiator   | iSCSI Target Initiator |

Note: These are common terminology mappings only and might not represent every case for this data source.

## Configuration

| Field                              | Description                                                         |
|------------------------------------|---------------------------------------------------------------------|
| Unity Storage                      | IP address or fully-qualified domain name of the Unity device       |
| User Name                          | User name for the Unity device                                      |
| Password                           | Password for the Unity device                                       |
| Full Path to the Executable UEMCLI | Full path to the folder containing the <i>uemcli.exe</i> executable |

## Advanced configuration

| Field                           | Description                                                 |
|---------------------------------|-------------------------------------------------------------|
| Inventory Poll Interval (min)   | Interval between inventory polls. The default is 40 minutes |
| Unity CLI Port                  | Port used for the Unity CLI                                 |
| Performance poll interval (sec) | The default is 300.                                         |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                 | Try this:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Dell EMC VMAX and PowerMax Family of Devices data collector

Cloud Insights discovers EMC VMAX and PowerMax storage arrays by using Solutions Enabler symcli commands in conjunction with an existing Solutions Enabler server in your environment. The existing Solutions Enabler server has connectivity to the VMAX/PowerMax storage array through access to gatekeeper volumes.

### Requirements

Before configuring this data collector, you should ensure that Cloud Insights has TCP connectivity to port 2707 on the existing Solutions Enabler server. Cloud Insights discovers all the Symmetrix arrays that are "Local" to this server, as seen in "symcfg list" output from that server.

- The EMC Solutions Enabler (CLI) with SMI-S provider application must be installed on the Acquisition Unit server and the version must match or be earlier than the version running on the Solutions Enabler Server.
- A properly configured {installdir}\EMC\SYMAPI\config\netcnfg file is required. This file defines service names for Solutions Enabler servers, as well as the access method (SECURE / NOSECURE /ANY).
- If you require read/write latency at the storage node level, the SMI-S Provider must communicate with a running instance of the UNISPHERE for VMAX application.
- IP address of the managing Solutions Enabler server
- Administrator permissions on the Solutions Enabler (SE) Server
- Read-only user name and password to the SE software
- The UNISPHERE for VMAX application must be running and collecting statistics for the EMC VMAX and PowerMax sstorage arrays that are managed by the SMI-S Provider installation
- Access validation for performance: In a web browser on your Acquisition Unit, go to *https://<SMI-S Hostname or IP>:5989/ecomconfig* where "SMI-S Hostname or IP" is the IP address or hostname of your SMI-S server. This URL is for an administrative portal for the EMC SMI-S (aka "ECOM") service - you will receive a login popup.
- Permissions must be declared in the Solutions Enabler server's daemon configuration file, usually found here: */var/symapi/config/daemon\_users*

Here is an example file with the proper cisys permissions.

```
root@cernciaukc101:/root
14:11:25 # tail /var/symapi/config/daemon_users
###
###      Refer to the storrdfd(3) man page for additional details.
###
###      As noted above, only authorized users can perform stordaeomon
control
###      operations (e.g., shutdown).
#####
#####
# smith          storrdfd
cisys storapid <all>
```

## Terminology

Cloud Insights acquires the following inventory information from the EMC VMAX/PowerMax data source. For each asset type acquired, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term                        | Cloud Insights Term |
|------------------------------------------|---------------------|
| Disk                                     | Disk                |
| Disk Group                               | Disk Group          |
| Storage                                  | Array Storage       |
| Director                                 | Storage Node        |
| Device Pool, Storage Resource Pool (SRP) | Storage Pool        |
| Device TDev                              | Volume              |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Configuration

**Note:** If SMI-S user authentication is not enabled, the default values in the Cloud Insights data collector are ignored.

| Field                 | Description                                          |
|-----------------------|------------------------------------------------------|
| Service Name          | Service name as specified in <i>netcnfg</i> file     |
| Full path to CLI      | Full path to the folder containing the Symmetrix CLI |
| SMI-S Host IP Address | IP address of the SMI-S host                         |

## Advanced Configuration

| Field                                           | Description                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------------------|
| Inventory Poll Interval (min)                   | Interval between inventory polls. The default is 40 minutes.                     |
| Choose 'Exclude' or 'Include' to specify a list | Specify whether to include or exclude the array list below when collecting data. |
| Inventory Filter Device List                    | Comma-separated list of device IDs to include or exclude                         |

| Field                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Caching                              | <p>Choose connection caching method:</p> <p>* LOCAL means that the Cloud Insights Acquisition service is running on the Solutions Enabler server, which has Fibre Channel connectivity to the Symmetrix arrays you seek to discover, and has access to gatekeeper volumes. This might be seen in some Remote Acquisition Unit (RAU) configurations.</p> <p>* REMOTE_CACHED is the default and should be used in most cases. This uses the NETCNFG file settings to connect using IP to the Solutions Enabler server, which must have Fibre Channel connectivity to the Symmetrix arrays you seek to discover, and has access to Gatekeeper volumes.</p> <p>* In the event that REMOTE_CACHED options make CLI commands fail, use the REMOTE option. Keep in mind that it will slow down the acquisition process (possibly to hours or even days in extreme cases). The NETCNFG file settings are still used for an IP connection to the Solutions Enabler server that has Fibre Channel connectivity to the Symmetrix arrays being discovered.</p> <p><b>Note:</b> This setting does not change Cloud Insights behavior with respect to the arrays listed as REMOTE by the "symcfg list" output. Cloud Insights gathers data only on devices shown as LOCAL by this command.</p> |
| SMI-S Protocol                                  | Protocol used to connect to the SMI-S provider. Also displays the default port used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Override SMIS-Port                              | If blank, use the default port in the Connection Type field, otherwise enter the connection port to use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SMI-S User Name                                 | User name for the SMI-S Provider Host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Dell EMC VNX Block Storage (NaviCLI) data collector

Cloud Insights uses the Dell EMC VNX Block Storage (NaviSec) data collector (formerly CLARiiON) to acquire inventory and performance data.

### Terminology

Cloud Insights acquires the following inventory information from the EMC VNX Block Storage data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term     | Cloud Insights Term |
|-----------------------|---------------------|
| Disk                  | Disk                |
| Storage               | Storage             |
| Storage Processor     | Storage Node        |
| This Pool, RAID Group | Storage Pool        |
| LUN                   | Volume              |

Note: These are common terminology mappings only and might not represent every case for this data source.

## Requirements

The following requirements must be met in order to collect data:

- An IP address of each VNX block storage processor
- Read-only Navisphere username and password to the VNX block storage arrays
- NaviSecCli must be installed on the Cloud Insights AU
- Access validation: Run NaviSecCLI from the Cloud Insights AU to each array using the username and password.
- Port requirements: 80, 443
- NaviSecCLI version should correspond with the newest FLARE code on your array
- For performance, statistics logging must be enabled.

## Navisphere command line interface syntax

```
naviseccli.exe -h <IP address> -user <user> -password <password> -scope
<scope>,use 0 for global scope> -port <use 443 by default> command
```

## Configuration

| Field                        | Description                                                             |
|------------------------------|-------------------------------------------------------------------------|
| VNX Block Storage IP Address | IP address or fully-qualified domain name of the VNX block storage      |
| User Name                    | Name used to log into the VNX block storage device.                     |
| Password                     | Password used to log into the VNX block storage device.                 |
| CLI Path to naviseccli.exe   | Full path to the folder containing the <i>naviseccli.exe</i> executable |

## Advanced Configuration

| Field                         | Description                                              |
|-------------------------------|----------------------------------------------------------|
| Inventory Poll Interval (min) | Interval between inventory polls. Default is 40 minutes. |

| Field                           | Description                                                     |
|---------------------------------|-----------------------------------------------------------------|
| Scope                           | The secure client scope. The default is Global.                 |
| Performance Poll Interval (sec) | Interval between performance polls. The default is 300 seconds. |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                                                                   | Try this:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## DELL EMC VNX File (formerly Celerra Unified Storage System) data collector

This data collector acquires inventory information from the VNX File Storage System. For configuration, this data collector requires the IP address of the storage processors and a read-only user name and password.

### Terminology

Cloud Insights acquires the following inventory information from the VNX File data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term                           | Cloud Insights Term |
|---------------------------------------------|---------------------|
| Celerra Network Server/Celerra Storage Pool | Storage Pool        |
| File System                                 | Internal Volume     |
| Data Mover                                  | Controller          |
| File System mounted on a data mover         | File Share          |
| CIFS and NFS Exports                        | Share               |
| Disk Volume                                 | Backend LUN         |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

You need the following to configure this data collector:

- The IP address of the storage processor
- Read-only user name and password
- SSH port 22

## Configuration

| Field               | Description                                                      |
|---------------------|------------------------------------------------------------------|
| VNX File IP Address | IP address or fully-qualified domain name of the VNX File device |
| User Name           | Name used to log in to the VNX File device                       |
| Password            | Password used to log in to the VNX File device                   |

## Advanced configuration

| Field                             | Description                                                  |
|-----------------------------------|--------------------------------------------------------------|
| Inventory Poll Interval (minutes) | Interval between inventory polls. The default is 20 minutes. |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                               | Try this:                                                                                                                            |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Error: Unable to proceed while DART update in progress | Possible solution: Pause the data collector and wait for the DART upgrade to complete before attempting another acquisition request. |

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Configuring the Dell EMC VNX Unified data collector

For configuration, the Dell EMC VNX Unified (SSH) data collector requires the IP address of the Control Station and a read-only username and password.

## Terminology

Cloud Insights acquires the following inventory information from this data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term                   | Cloud Insights Term |
|-------------------------------------|---------------------|
| Disk                                | Disk                |
| Disk Folder                         | Disk Group          |
| File system                         | Internal Volume     |
| Storage                             | Storage             |
| Storage Processor                   | Storage Node        |
| Storage Pool, RAID Group            | Storage Pool        |
| LUN                                 | Volume              |
| Data Mover                          | Controller          |
| File System mounted on a data mover | File Share          |
| CIFS and NFS Exports                | Share               |
| Disk Volume                         | Backend LUN         |

## Requirements

You need the following to configure the VNX (SSH) data collector:

- VNX IP address & Credentials to the Celerra Control Station.
- Read-only username and password.
- The data collector is able to run NaviCLI/NaviSecCLI commands against the backend array utilizing the DART OS NAS heads

## Configuration

| Field          | Description                                                          |
|----------------|----------------------------------------------------------------------|
| VNX IP Address | IP address or fully-qualified domain name of the VNX Control Station |
| User Name      | User name for the VNX Control Station                                |
| Password       | Password for the VNX Control Station                                 |

## Advanced configuration

| Field                            | Description                                                     |
|----------------------------------|-----------------------------------------------------------------|
| Inventory Poll Interval (min)    | Interval between inventory polls. The default is 40 minutes.    |
| Performance Poll Interval (sec). | Interval between performance polls. The default is 300 seconds. |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Configuring the EMC VPLEX data collector

This data collector acquires inventory and performance data from EMC VPLEX storage systems. For configuration, the data collector requires an IP address of the VPLEX server and an administrative level domain account.

Cloud Insights' performance collection from Vplex clusters requires that the performance archive service be operational, in order to populate the .CSV files and logs that Cloud Insights retrieves via SCP-based file copies. NetApp has observed that many Vplex firmware upgrade/management station updates will leave this functionality non-operational. Customers planning such upgrades may want to proactively ask Dell/EMC if their planned upgrade will leave this functionality inoperable, and if so, how can they re-enable it to minimize gaps in performance visibility? Cloud Insight's Vplex performance code will assess on each poll whether all the expected files exist, and if they are being properly updated; if they are missing or stale, Cloud Insights will log performance collection failures.

### Terminology

Cloud Insights acquires the following inventory information from the VPLEX data collector. For each asset type acquired, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term             | Cloud Insights Term     |
|-------------------------------|-------------------------|
| Cluster                       | Storage                 |
| Engine                        | Storage Node            |
| Device, System Extent         | Backend Storage Pool    |
| Virtual Volume                | Volume                  |
| Front-End Port, Back-End Port | Port                    |
| Distributed Device            | Storage Synchronization |
| Storage View                  | Volume Map, Volume Mask |
| Storage Volume                | Backend LUN             |
| ITLs                          | Backend Path            |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

- An IP address of the VPLEX Management Console
- Administrative level domain account for the VPLEX server
- Port 443 (HTTPS). Requires outbound connectivity to TCP port 443 on the VPLEX management station.
- For performance, read-only username and password for ssh/scp access.
- For performance, port 22 is required.

## Configuration

| Field                                  | Description                                                               |
|----------------------------------------|---------------------------------------------------------------------------|
| IP address of VPLEX Management Console | IP address or fully-qualified domain name of the VPLEX Management Console |
| User Name                              | User name for VPLEX CLI                                                   |
| Password                               | Password used for VPLEX CLI                                               |
| Performance Remote IP Address          | Performance Remote IP address of the VPLEX Management Console             |
| Performance Remote User Name           | Performance Remote user name of VPLEX Management Console                  |
| Performance Remote Password            | Performance Remote Password of VPLEX Management Console                   |

## Advanced configuration

| Field                           | Description                                                     |
|---------------------------------|-----------------------------------------------------------------|
| Communication Port              | Port used for VPLEX CLI. The default is 443.                    |
| Inventory Poll Interval (min)   | The default is 20 minutes.                                      |
| Number of connection retries    | The default is 3.                                               |
| Performance Poll Interval (sec) | Interval between performance polls. The default is 600 seconds. |
| Number of Retries               | The default is 2.                                               |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                           | Try this:                                               |
|------------------------------------|---------------------------------------------------------|
| Error: User authentication failed. | Make sure your credentials for this device are correct. |

### Performance

| Problem:                                                         | Try this:                                                                                                                                                       |
|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error: VPLEX performance for version below 5.3 is not supported. | Upgrade VPLEX to 5.3 or above                                                                                                                                   |
| Error: No enough data collected.                                 | <ul style="list-style-type: none"><li>• Check collection timestamp in log file and modify polling interval accordingly</li><li>• Wait for longer time</li></ul> |
| Error: Perpetual Log files not being updated.                    | Please contact EMC support to enable updating the perpetual log files                                                                                           |

| <b>Problem:</b>                                                                     | <b>Try this:</b>                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error: Performance polling interval is too big.                                     | Check collection timestamp in log file \${logfile} and modify polling interval accordingly                                                                                                                             |
| Error: Performance Remote IP address of VPLEX Management Console is not configured. | Edit the data source to set Performance Remote IP address of VPLEX Management Console.                                                                                                                                 |
| Error: No performance data reported from director                                   | <ul style="list-style-type: none"> <li>• Check that the system performance monitors are running correctly</li> <li>• Please contact EMC support to enable updating the system performance monitor log files</li> </ul> |

## Dell EMC XtremIO data collector

The EMC XtremIO data collector acquires inventory and performance data from the EMC XtremIO storage system.

### Requirements

To configure the EMC XtremIO (HTTP) data collector, you must have:

- The XtremIO Management Server (XMS) Host address
- An account with administrator privileges
- Access to port 443 (HTTPS)

### Terminology

Cloud Insights acquires the following inventory information from the EMC XtremIO data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data source, keep the following terminology in mind:

| <b>Vendor/Model Term</b> | <b>Cloud Insights Term</b> |
|--------------------------|----------------------------|
| Disk (SSD)               | Disk                       |
| Cluster                  | Storage                    |
| Controller               | Storage Node               |
| Volume                   | Volume                     |
| LUN Map                  | Volume Map                 |
| Target FC Initiator      | Volume Mask                |

Note: These are common terminology mappings only and might not represent every case for this data source.

### Requirements

- The XtremIO Management Server (XMS) Host IP address
- Administrator user name and password for the XtremIO

## Configuration

| Field     | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| XMS Host  | IP address or fully-qualified domain name of the XtremIO Management Server |
| User name | User name for the XtremIO Management Server                                |
| Password  | Password for the XtremIO Management Server                                 |

## Advanced configuration

| Field                           | Description                                                                |
|---------------------------------|----------------------------------------------------------------------------|
| TCP port                        | TCP Port used to connect to XTremIO Management Server. The default is 443. |
| Inventory poll interval (min)   | Interval between inventory polls. The default is 60 minutes.               |
| Performance poll interval (sec) | Interval between performance polls. The default is 300 seconds.            |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

# Fujitsu Eternus data collector

The Fujitsu Eternus data collector acquires inventory data using administration-level access to the storage system.

## Terminology

Cloud Insights acquires the following inventory information from the Fujitsu Eternus storage. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term                                                                                                                                             | Cloud Insights Term |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| Disk                                                                                                                                                          | Disk                |
| Storage                                                                                                                                                       | Storage             |
| Thin Pool, Flexible Tier Pool, Raid Group                                                                                                                     | Storage Pool        |
| Standard Volume, Snap Data Volume (SDV), Snap Data Pool Volume (SDPV), Thin Provisioning Volume (TPV), Flexible Tier Volume (FTV), Wide Striping Volume (WSV) | Volume              |
| Channel adapter                                                                                                                                               | Controller          |

Note: These are common terminology mappings only and might not represent every case for this data

collector.

## Requirements

The following are required to configure this data collector:

- An IP address of the Eternus storage, which cannot be comma delimited
- SSH Administration-level user name and password
- Port 22
- Ensure that the page scroll is disabled (clienv-show-more-scroll disable)

## Configuration

| Field                         | Description                       |
|-------------------------------|-----------------------------------|
| IP Address of Eternus Storage | IP address of the Eternus storage |
| User Name                     | User name for Eternus storage     |
| Password                      | Password for the Eternus storage  |

## Advanced configuration

| Field                         | Description                |
|-------------------------------|----------------------------|
| Inventory Poll Interval (min) | The default is 20 minutes. |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                                                             | Try this:                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# NetApp Google Compute data collector

This data collector supports inventory and performance collection from Google Compute cloud platform configurations. This collector will seek to discover all the Compute resources within all the Projects within one Google organization. If you have multiple Google organizations you want to discover with Cloud Insights, you will want to deploy one Cloud Insights collector per organization.

## Configuration

| Field                                                           | Description                                                                                                                                                      |
|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Organization ID                                                 | The organization ID you want to discover with this collector. This field is required if your service account is able to see more than one organization           |
| Choose 'Exclude' or 'Include' to filter GCP Projects by IDs     | If you want to limit what projects' resources are brought into Cloud Insights.                                                                                   |
| Project IDs                                                     | The list of Project IDs that you want to filter in, or out from discovery, depending on the value of the "Choose 'Exclude'...." value. The default list is empty |
| Client ID                                                       | Client ID for the Google Cloud Platform configuration                                                                                                            |
| Copy and paste the contents of your Google Credential File here | Copy your Google credentials for the Cloud Platform account to this field                                                                                        |

## Advanced configuration

| Field                                                          | Description                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inventory Poll Interval (min)                                  | Default is 60 minutes                                                                                                                                                                                                                                                                                         |
| Choose 'Exclude' or 'Include' to Apply to Filter VMs by Labels | Specify whether to include or exclude VM's by Labels when collecting data. If 'Include' is selected, the Label Key field can not be empty.                                                                                                                                                                    |
| Label Keys and Values on which to Filter VMs                   | Click + <b>Filter Label</b> to choose which VMs (and associated disks) to include/exclude by filtering for keys and values that match keys and values of labels on the VM. Label Key is required, Label Value is optional. When Label Value is empty, the VM is filtered as long as it matches the Label Key. |
| Performance Poll Interval (sec)                                | Default is 1800 seconds                                                                                                                                                                                                                                                                                       |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

# HP Enterprise

## HP Enterprise Alletra 9000 / Primera Storage data collector

Cloud Insights uses the HP Enterprise Alletra 9000 / HP Enterprise Primera (previously 3PAR) data collector to discover inventory and performance.

### Terminology

Cloud Insights acquires the following inventory information from this data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Field                     | Description  |
|---------------------------|--------------|
| Physical Disk             | Disk         |
| Storage System            | Storage      |
| Controller Node           | Storage Node |
| Common Provisioning Group | Storage Pool |
| Virtual Volume            | Volume       |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

The following are required to configure this data collector:

- IP address or FQDN of the InServ cluster
- For inventory, read-only user name and password to the StoreServ Server
- For performance, read-write user name and password to the StoreServ Server
- Port requirements: 22 (inventory collection), 5988 or 5989 (performance collection) [Note: Performance is supported for StoreServ OS 3.x+]
- For performance collection confirm that SMI-S is enabled by logging into the array via SSH.

### Configuration

| Field              | Description                                                                |
|--------------------|----------------------------------------------------------------------------|
| Storage IP address | Storage IP address or fully-qualified domain name of the StoreServ cluster |
| User Name          | User name for the StoreServ Server                                         |
| Password           | Password used for the StoreServ Server                                     |
| SMI-S User Name    | User name for the SMI-S Provider Host                                      |
| SMI-S Password     | Password used for the SMI-S Provider Host                                  |

## Advanced configuration

| Field                           | Description                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------|
| Inventory Poll Interval (min)   | Interval between inventory polls. The default is 40 minutes.                                       |
| SMI-S Connectivity              | Protocol used to connect to the SMI-S provider                                                     |
| Override SMI-S Default Port     | If blank, use the default port from SMI-S Connectivity, otherwise enter the connection port to use |
| Performance Poll Interval (sec) | Interval between performance polls. The default is 300 seconds.                                    |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                     | Try this:                                                                                                    |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| "showsys" command doesn't return any result. | Run "showsys" and "showversion -a" from the command line and check if the version is supported by the array. |

### Performance

| Problem:                                                             | Try this:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Failed to connect or login. Provider initialization failed.          | An all-numeric array name can cause problems with SMI-S server. Try changing the array name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SMI-S user configured does not have any domain                       | Grant appropriate domain privileges to the configured SMI-S user                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Cloud Insights states that it cannot connect/login to SMI-S service. | <p>Confirm there is no firewall between the CI AU and the array that would block the CI AU from making TCP connections to 5988 or 5989.</p> <p>Once that is done, and if you have confirmed there is no firewall, you should SSH to the array, and use the "showcim" command to confirm.</p> <p>Verify that:</p> <ul style="list-style-type: none"><li>* Service is enabled</li><li>* HTTPS is enabled</li><li>* HTTPS port should be 5989</li></ul> <p>If those all are so, you can try to "stopcim" and then a "startcim" to restart the CIM (i.e. SMI-S service).</p> |

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## HP Enterprise Command View data collector

The HP Enterprise Command View Advanced Edition data collector supports discovering XP and P9500 arrays via Command View Advanced Edition (CVAE) server. Cloud Insights communicates with CVAE using the standard Command View API to collect inventory and performance data.

### Terminology

Cloud Insights acquires the following inventory information from the HP Enterprise Command View data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term    | Cloud Insights Term |
|----------------------|---------------------|
| PDEV                 | Disk                |
| Journal Pool         | Disk Group          |
| Storage Array        | Storage             |
| Port Controller      | Storage Node        |
| Array Group, DP Pool | Storage Pool        |
| Logical Unit, LDEV   | Volume              |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Inventory requirements

You must have the following in order to collect inventory data:

- IP address of the CVAE server
- Read-only user name and password for the CVAE software and peer privileges
- Port requirement: 2001

### Performance requirements

The following requirements must be met in order to collect performance data:

- HDS USP, USP V, and VSP performance
  - Performance Monitor must be licensed.
  - Monitoring switch must be enabled.
  - The Export Tool (Export.exe) must be copied to the Cloud Insights AU and extracted to a location. On CI Linux AUs, ensure "cisyss" has read and execute permissions.
  - The Export Tool version must match the microcode version of the target array.
- AMS performance:
  - Performance Monitor must be licensed.
  - The Storage Navigator Modular 2 (SNM2) CLI utility be installed on the Cloud Insights AU.

- Network requirements
  - The Export Tools are Java based, and use RMI to speak to the array. These tools may not be firewall-friendly as they may dynamically negotiate source and destination TCP ports on each invocation. Also, different model array's Export Tools may behave differently across the network - consult HPE for your model's requirements

## Configuration

| Field                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command View Server                                                     | IP address or fully-qualified domain name of the Command View server                                                                                                                                                                                                                                                                                                                             |
| User Name                                                               | User name for the Command View server.                                                                                                                                                                                                                                                                                                                                                           |
| Password                                                                | Password used for the Command View server.                                                                                                                                                                                                                                                                                                                                                       |

## HPE Alletra 6000 data collector

The HP Enterprise Alletra 6000 (previously Nimble) data collector supports inventory and performance data for Alletra 6000 storage arrays.

### Terminology

Cloud Insights acquires the following inventory information from this collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term       | Cloud Insights Term |
|-------------------------|---------------------|
| Array                   | Storage             |
| Disk                    | Disk                |
| Volume                  | Volume              |
| Pool                    | Storage Pool        |
| Initiator               | Storage Host Alias  |
| Controller              | Storage Node        |
| Fibre Channel Interface | Controller          |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

You must have the following in order to collect inventory and configuration data from the storage array:

- The array must be installed and configured, and reachable from the client through its fully qualified domain name (FQDN) or array management IP address.
- The array must be running NimbleOS 2.3.x or later.
- You must have a valid user name and password to the array with at least "Operator" level role. The "Guest" role does not have sufficient access to understand initiator configurations.
- Port 5392 must be open on the array.

You must have the following in order to collect performance data from the storage array:

- The array must be running NimbleOS 4.0.0 or later
- The array must have volumes configured. The only performance API NimbleOS has is for volumes, and any statistics Cloud Insights reports are derived from the statistics on volumes

### Configuration

| Field                       | Description                                                        |
|-----------------------------|--------------------------------------------------------------------|
| Array Management IP Address | Fully qualified domain name (FQDN) or array management IP address. |
| User Name                   | User name for the array                                            |

| Field    | Description            |
|----------|------------------------|
| Password | Password for the array |

### Advanced configuration

| Field                         | Description                                                  |
|-------------------------------|--------------------------------------------------------------|
| Port                          | Port used by Nimble REST API. The default is 5392.           |
| Inventory Poll Interval (min) | Interval between inventory polls. The default is 60 minutes. |

Note: The default performance poll interval is 300 seconds and can not be changed. This is the only interval supported by HPE Alletra 6000.

## Hitachi Data Systems

### Hitachi Vantara Command Suite data collector

The Hitachi Vantara Command Suite data collector supports the HiCommand Device Manager server. Cloud Insights communicates with the HiCommand Device Manager server using the standard HiCommand API.

### Terminology

Cloud Insights acquires the following inventory information from the Hitachi Vantara Command Suite data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term     | Cloud Insights Term |
|-----------------------|---------------------|
| PDEV                  | Disk                |
| Journal Pool          | Disk Group          |
| Storage Array         | Storage             |
| Port Controller       | Storage Node        |
| Array Group, HDS Pool | Storage Pool        |
| Logical Unit, LDEV    | Volume              |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Storage

The following terms apply to objects or references that you might find on HDS storage asset landing pages. Many of these terms apply to other data collectors as well.

- Name – comes directly from HDS HiCommand Device Manager’s “name” attribute via the GetStorageArray XML API call

- Model - comes directly from HDS HiCommand Device Manager's "arrayType" attribute via the GetStorageArray XML API call
- Vendor – HDS
- Family - comes directly from HDS HiCommand Device Manager's "arrayFamily" attribute via the GetStorageArray XML API call
- IP – this is the management IP address of the array, not an exhaustive list of all IP addresses on the array
- Raw Capacity – a base2 value representing the sum of the total capacity of all disks in this system, regardless of disk role.

### Storage Pool

The following terms apply to objects or references that you might find on HDS storage pool asset landing pages. Many of these terms apply to other data collectors as well.

- Type: The value here will be one of:
  - RESERVED – if this pool is dedicated for purposes other than data volumes, i.e, journaling, snapshots
  - Thin Provisioning – if this is a HDP pool
  - Raid Group – you will not likely see these for a few reasons:

Cloud Insights takes a strong stance to avoid double counting capacity at all costs. On HDS, one typically needs to build Raid Groups from disks, create pool volumes on those Raid Groups, and construct pools (often HDP, but could be special purpose) from those pool volumes. If Cloud Insights reported both the underlying Raid Groups as is, as well as the Pools, the sum of their raw capacity would vastly exceed the sum of the disks.

Instead, Cloud Insights' HDS Command Suite data collector arbitrarily shrinks the size of Raid Groups by the capacity of pool volumes. This may result in Cloud Insights not reporting the Raid Group at all. Additionally, any resulting Raid Groups are flagged in a way such that they are not visible in the Cloud Insights WebUI, but they do flow into the Cloud Insights Data Warehouse (DWH). The purpose of these decisions is to avoid UI clutter for things that most users do not care about – if your HDS array has Raid Groups with 50MB free, you probably cannot use that free space for any meaningful outcome.

- Node - N/A, as HDS pools are not tied to any one specific node
- Redundancy - the RAID level of the pool. Possibly multiple values for a HDP pool comprised of multiple RAID types
- Capacity % - the percent used of the pool for data usage, with the used GB and total logical GB size of the pool
- Over-committed Capacity - a derived value, stating "the logical capacity of this pool is oversubscribed by this percentage by virtue of the sum of the logical volumes exceeding the logical capacity of the pool by this percentage"
- Snapshot - shows the capacity reserved for snapshot usage on this pool

### Storage Node

The following terms apply to objects or references that you might find on HDS storage node asset landing pages. Many of these terms apply to other data collectors as well.

- Name – The name of the Front-end director (FED) or Channel Adapter on monolithic arrays, or the name of the controller on a modular array. A given HDS array will have 2 or more Storage Nodes

- Volumes – The Volume table will show any volume mapped to any port owned by this storage node

## Inventory Requirements

You must have the following in order to collect inventory data:

- IP address of the HiCommand Device Manager server
- Read-only user name and password for the HiCommand Device Manager software and peer privileges
- Port requirements: 2001 (http) or 2443 (https)
- Log into HiCommand Device Manager software using username and password
- Verify access to HiCommand Device Manager [http://<HiCommand\\_Device\\_Manager\\_IP>:2001/service/StorageManager](http://<HiCommand_Device_Manager_IP>:2001/service/StorageManager)

## Performance requirements

The following requirements must be met in order to collect performance data:

- HDS USP, USP V, and VSP performance
  - Performance Monitor must be licensed.
  - Monitoring switch must be enabled.
  - The Export Tool (Export.exe) must be copied to the Cloud Insights AU.
  - The Export Tool version must match the microcode version of the target array.
- AMS performance:
  - NetApp strongly recommends creating a dedicated service account on AMS arrays for Cloud Insights to use to retrieve performance data. Storage Navigator only allows a user account one concurrent login to the array. Having Cloud Insights use the same user account as management scripts or HiCommand may result in Cloud Insights, management scripts, or HiCommand being unable to communicate to the array due to the one concurrent user account login limit
  - Performance Monitor must be licensed.
  - The Storage Navigator Modular 2 (SNM2) CLI utility needs to be installed on the Cloud Insights AU.

## Configuration

| Field            | Description                                                                      |
|------------------|----------------------------------------------------------------------------------|
| HiCommand Server | IP address or fully-qualified domain name of the HiCommand Device Manager server |
| User Name        | User name for the HiCommand Device Manager server.                               |
| Password         | Password used for the HiCommand Device Manager server.                           |

| Field                                                                   | Description                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Devices - VSP G1000 (R800), VSP (R700), HUS VM (HM700) and USP storages | Device list for VSP G1000 (R800), VSP (R700), HUS VM (HM700) and USP storages. Each storage requires:<br><br>* Array's IP: IP address of the storage<br>* User Name: User name for the storage<br>* Password: Password for the storage<br>* Folder Containing Export Utility JAR Files                                        |

Each storage requires:<br><br>* Array's IP: IP address of the storage<br>* Storage Navigator CLI Path: SNM2 CLI path<br>* Account Authentication Valid: Select to choose valid account authentication<br>* User Name: User name for the storage<br>* Password: Password for the storage |
| Choose Tuning Manager for Performance                                   | Override other performance options                                                                                                                                                                                                                                                                                            |
| Tuning Manager Host                                                     | IP address or fully-qualified domain name of tuning manager                                                                                                                                                                                                                                                                   |
| Override Tuning Manager Port                                            | If blank, use the default port in the Choose Tuning Manager for Performance field, otherwise enter the port to use                                                                                                                                                                                                            |
| Tuning Manager Username                                                 | User name for Tuning Manager                                                                                                                                                                                                                                                                                                  |
| Tuning Manager Password                                                 | Password for Tuning Manager                                                                                                                                                                                                                                                                                                   |

Note: In HDS USP, USP V, and VSP, any disk can belong to more than one array group.

### Advanced configuration

| Field                                           | Description                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------------------|
| Connection Type                                 | HTTPS or HTTP, also displays the default port                                    |
| HiCommand Server Port                           | Port used for the HiCommand Device Manager                                       |
| Inventory Poll Interval (min)                   | Interval between inventory polls. The default is 40.                             |
| Choose 'Exclude' or 'Include' to specify a list | Specify whether to include or exclude the array list below when collecting data. |
| Filter device List                              | Comma-separated list of device serial numbers to include or exclude              |
| Performance Poll Interval (sec)                 | Interval between performance polls. The default is 300.                          |
| Export timeout in seconds                       | Export utility timeout. The default is 300.                                      |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                     | Try this:                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error: User does not have enough permission                                                                  | Use a different user account that has more privilege or increase the privilege of user account configured in the data collector                                                                                           |
| Error: Storages list is empty. Either devices are not configured or the user does not have enough permission | <ul style="list-style-type: none"><li>* Use DeviceManager to check if the devices are configured.</li><li>* Use a different user account that has more privilege, or increase the privilege of the user account</li></ul> |
| Error: HDS storage array was not refreshed for some days                                                     | Investigate why this array is not being refreshed in HDS HiCommand.                                                                                                                                                       |

### Performance

| Problem:                                                                                                                           | Try this:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Configuring the Hitachi Vantara NAS data collector

The Hitachi Vantara NAS data collector is an inventory and configuration data collector that supports discovery of HDS NAS clusters. Cloud Insights supports discovering NFS and CIFS shares, file systems (Internal Volumes), and spans (Storage Pools).

## Terminology

Cloud Insights acquires the following inventory information from the HNAS data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Tier              | Disk Group          |
| Cluster           | Storage             |
| Node              | Storage Node        |
| Span              | Storage Pool        |
| System Drive      | Backend Lun         |
| Files System      | Internal Volume     |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- Device IP address
- Port 22, SSH protocol
- Username and password - privilege level: Supervisor
- Note: This data collector is SSH based, so the AU that hosts it must be able to initiate SSH sessions to TCP 22 on the HNAS itself, or the Systems Management Unit (SMU) that the cluster is connected to.

## Configuration

| Field     | Description                                                       |
|-----------|-------------------------------------------------------------------|
| HNAS Host | IP address or fully-qualified domain name of HNAS Management Host |
| User Name | User name for HNAS CLI                                            |
| Password  | Password used for HNAS CLI                                        |

## Advanced configuration

| Field                         | Description                                                  |
|-------------------------------|--------------------------------------------------------------|
| Inventory Poll Interval (min) | Interval between inventory polls. The default is 30 minutes. |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

## Inventory

| Problem:                                                                                                        | Try this:                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| "Error connecting" with error messages "Error setting up shell channel:" or "Error opening shell channel"       | Likely caused by network connectivity issues or SSH is misconfigured. Confirm connection with alternate SSH client |
| "Timeout" or "Error retrieving data" with error messages "Command: XXX has timed out."                          | * Try the command with alternate SSH client<br>* Increase timeout                                                  |
| "Error connecting " or "Invalid login credentials" with error messages "Could not communicate with the device:" | * Check IP address<br>* Check user name and password<br>* Confirm connection with alternate SSH client             |

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Hitachi Ops Center data collector

This data collector uses Hitachi Ops Center's integrated suite of applications to access inventory and performance data of multiple storage devices. For inventory and capacity discovery, your Ops Center installation must include both the "Common Services" and "Administrator" components. For performance collection, you must additionally have "Analyzer" deployed.

## Terminology

Cloud Insights acquires the following inventory information from this data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term      | Cloud Insights Term                   |
|------------------------|---------------------------------------|
| Storage Systems        | Storage                               |
| Volume                 | Volume                                |
| Parity Groups          | Storage Pool(RAID), Disk Groups       |
| Disk                   | Disk                                  |
| Storage Pool           | Storage Pool(Thin, SNAP)              |
| External Parity Groups | Storage Pool(Backend), Disk Groups    |
| Port                   | Storage Node → Controller Node → Port |
| Host Groups            | Volume Mapping and Masking            |
| Volume Pairs           | Storage Synchronization               |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Inventory Requirements

You must have the following in order to collect inventory data:

- IP address or hostname of the Ops Center server hosting the "Common Services" component
- Root/sysadmin user account and password that exist on all servers hosting Ops Center components. HDS did not implement REST API support for usage by LDAP/SSO users until Ops Center 10.8+

## Performance requirements

The following requirements must be met in order to collect performance data:

The HDS Ops Center "Analyzer" module must be installed  
Storage arrays must be feeding the Ops Center "Analyzer" module

## Configuration

| Field                         | Description                                                                                                |
|-------------------------------|------------------------------------------------------------------------------------------------------------|
| Hitachi Ops Center IP Address | IP address or fully-qualified domain name of the Ops Center server hosting the "Common Services" component |
| User Name                     | User name for the Ops Center server.                                                                       |
| Password                      | Password used for the Ops Center server.                                                                   |

## Advanced configuration

| Field                                           | Description                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------------------|
| Connection Type                                 | HTTPS (port 443) is the default                                                  |
| Override TCP Port                               | Specify the port to use if not the default                                       |
| Inventory Poll Interval (min)                   | Interval between inventory polls. The default is 40.                             |
| Choose 'Exclude' or 'Include' to specify a list | Specify whether to include or exclude the array list below when collecting data. |
| Filter device List                              | Comma-separated list of device serial numbers to include or exclude              |
| Performance Poll Interval (sec)                 | Interval between performance polls. The default is 300.                          |

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Infinidat InfiniBox data collector

The Infinidat InfiniBox (HTTP) data collector is used to collect inventory information from the Infinidat InfiniBox storage system.

## Terminology

Cloud Insights acquires the following inventory information from the Infinidat InfiniBox data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term  | Cloud Insights Term |
|--------------------|---------------------|
| Storage Pool       | Storage Pool        |
| Node               | Controller          |
| Filesystem         | Internal Volume     |
| Filesystem         | File Share          |
| Filesystem Exports | Share               |

## Requirements

The following are requirements when configuring this data collector.

- IP address or FQDN of InfiniBox management Node
- Admin userid and password
- Port 443 via REST API

## Configuration

| Field          | Description                                                                |
|----------------|----------------------------------------------------------------------------|
| InfiniBox Host | IP address or fully-qualified domain name of the InfiniBox Management Node |
| User Name      | User name for InfiniBox Management Node                                    |
| Password       | Password for the InfiniBox Management Node                                 |

## Advanced configuration

| Field                   | Description                                                       |
|-------------------------|-------------------------------------------------------------------|
| TCP Port                | TCP Port used to connect to InfiniBox Server. The default is 443. |
| Inventory Poll Interval | Interval between inventory polls. The default is 60 minutes.      |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Huawei OceanStor data collector

Cloud Insights uses the Huawei OceanStor (REST/HTTPS) data collector to discover inventory and performance for Huawei OceanStor and OceanStor Dorado storage.

## Terminology

Cloud Insights acquires the following inventory and performance information from the Huawei OceanStor. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term          | Cloud Insights Term  |
|----------------------------|----------------------|
| Storage Pool               | Storage Pool         |
| File System                | Internal Volume      |
| Controller                 | Storage Node         |
| FC Port (Mapped)           | Volume Map           |
| Host FC Initiator (Mapped) | Volume Mask          |
| NFS/CIFS Share             | Share                |
| iSCSI Link Target          | iSCSI Target Node    |
| iSCSI Link Initiator       | iSCSI Initiator Node |
| Disk                       | Disk                 |
| LUN                        | Volume               |

## Requirements

The following requirements are required to configure this data collector:

- Device IP address
- Credentials to access OceanStor device manager
- Port 8088 must be available

## Configuration

| Field                     | Description                                                               |
|---------------------------|---------------------------------------------------------------------------|
| OceanStor Host IP Address | IP address or fully-qualified domain name of the OceanStor Device Manager |
| User Name                 | Name used to log into the OceanStor Device Manager                        |
| Password                  | Password used to log into the OceanStor Device Manager                    |

## Advanced Configuration

| Field                         | Description                                                                |
|-------------------------------|----------------------------------------------------------------------------|
| TCP Port                      | TCP Port used to connect to OceanStor Device Manager. The default is 8088. |
| Inventory Poll Interval (min) | Interval between inventory polls. The default is 60 minutes.               |

| Field                            | Description                 |
|----------------------------------|-----------------------------|
| Performance poll interval (sec). | The default is 300 seconds. |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## IBM

### IBM Cleversafe data collector

Cloud Insights uses this data collector to discover inventory and performance data for IBM Cleversafe storage systems.

IBM Cleversafe is metered at a different Raw TB to Managed Unit rate. Every 40 TB of unformatted IBM Cleversafe capacity is charged as 1 [Managed Unit \(MU\)](#).

### Terminology

Cloud Insights acquires the following inventory information from the IBM Cleversafe data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Storage Pool      | Storage Pool        |
| Container         | Internal Volume     |
| Container         | File Share          |
| NFS Share         | Share               |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

- The external data services IP address for the cluster
- Administrator user name and password
- Port 9440

### Configuration

| Field                   | Description                                                                |
|-------------------------|----------------------------------------------------------------------------|
| Manager IP or host name | IP address or hostname of management node                                  |
| User name               | Username for the user account with super user or system administrator role |

| Field    | Description                                                                |
|----------|----------------------------------------------------------------------------|
| Password | Password for the user account with super user or system administrator role |

### Advanced configuration

| Field                         | Description                       |
|-------------------------------|-----------------------------------|
| Inventory poll interval (min) | Interval between inventory polls. |
| HTTP Connection Timeout (sec) | HTTP timeout in seconds.          |

### Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## IBM CS data collector

Cloud Insights uses this data collector to discover inventory and performance data for IBM CS storage systems.

### Terminology

Cloud Insights acquires the following inventory information from the IBM CS data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Storage Pool      | Storage Pool        |
| Container         | Internal Volume     |
| Container         | File Share          |
| NFS Share         | Share               |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

- The external data services IP address for the cluster
- Administrator user name and password
- Port 9440

### Configuration

| Field                     | Description                                           |
|---------------------------|-------------------------------------------------------|
| Prism External IP Address | The external data services IP address for the cluster |

| Field     | Description                     |
|-----------|---------------------------------|
| User name | User name for the Admin account |
| Password  | Password for the Admin account  |

### Advanced configuration

| Field                          | Description                                                        |
|--------------------------------|--------------------------------------------------------------------|
| TCP port                       | TCP Port used to connect to the IBM CS array. The default is 9440. |
| Inventory poll interval (min)  | Interval between inventory polls. The default is 60 minutes.       |
| Performance poll interval(sec) | Interval between performance polls. The default is 300 seconds.    |

### Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## IBM System Storage DS8000 Series data collector

The IBM DS (CLI) data collector supports inventory and performance data acquisition for DS6xxx and DS8xxx devices.

DS3xxx, DS4xxx, and DS5xxx devices are supported by the [NetApp E-Series data collector](#). You should refer to the Cloud Insights support matrix for supported models and firmware versions.

### Terminology

Cloud Insights acquires the following inventory information from the IBM DS data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term          | Cloud Insights Term |
|----------------------------|---------------------|
| Disk Drive Module          | Disk                |
| Storage Image              | Storage             |
| Extent Pool                | Storage Node        |
| Fixed Block Volume         | Volume              |
| Host FC Initiator (Mapped) | Volume Mask         |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

You need the following to configure this data collector:

- IP address of each DS array
- Read-only username and password on each DS array
- Third-party software installed on the Cloud Insights AU: IBM *dscli*
- Access validation: Run *dscli* commands using the username and password
- Port requirements: 80, 443, & 1750

## Configuration

| Field                        | Description                                                |
|------------------------------|------------------------------------------------------------|
| DS Storage                   | IP address or fully-qualified domain name of the DS device |
| User Name                    | User name for the DS CLI                                   |
| Password                     | Password for the DS CLI                                    |
| <i>dscli</i> executable path | Full path to the <i>dscli</i> executable                   |

## Advanced configuration

| Field                           | Description                                                                                            |
|---------------------------------|--------------------------------------------------------------------------------------------------------|
| Inventory Poll Interval (min)   | Interval between inventory polls (min). The default is 40.                                             |
| Storage Display Name            | Name of the IBM DS storage array                                                                       |
| Inventory Exclude Devices       | Comma-separated list of device serial numbers to exclude from inventory collection                     |
| Performance Poll Interval (sec) | The default is 300.                                                                                    |
| Performance Filter Type         | Include: Data collected only from devices on list.<br>Exclude: No data from these devices is collected |
| Performance Filter Device List  | Comma-separated list of device IDs to include or exclude from performance collection                   |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Configuring the IBM PowerVM data collector

The IBM PowerVM (SSH) data collector is used to collect information about virtual partitions running on IBM POWER hardware instances managed by a hardware management console (HMC).

### Terminology

Cloud Insights acquires inventory information from the virtual partitions running on IBM POWER hardware instances. For each asset type acquired, the most common terminology used for the asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| hdisk             | Virtual Disk        |
| Managed System    | Host                |
| LPAR, VIO Server  | Virtual Machine     |
| Volume Group      | Data Store          |
| Physical Volume   | LUN                 |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Requirements

The following requirements must be met to configure and use this data collector:

- IP address of the Hardware Management Console (HMC)
- User name and password that provide access to Hardware Management Console (HMC) through SSH
- Port requirement SSH-22
- View permission on all management systems and logical partition security domains

The user must also have View permission on HMC configurations and the ability to collect VPD information for the HMC console security grouping. The user must also be allowed Virtual IO Server Command access under the Logical Partition security grouping. It is a best practice to start from a role of an operator and

then remove all roles. Read-only users on the HMC do not have privileges to run proxied commands on AIX hosts.

- IBM best practice is to have the devices monitored by two or more HMCs. Be aware that this may cause OnCommand Insight to report duplicated devices, therefore it is highly recommended to add redundant devices to the "Exclude Devices" list in the Advanced Configuration for this data collector.

## Configuration

| Field                                        | Description                                                                          |
|----------------------------------------------|--------------------------------------------------------------------------------------|
| Hardware Management Console (HMC) IP Address | IP address or fully-qualified domain name of the PowerVM Hardware Management Console |
| HMC User                                     | User name for the Hardware Management Console                                        |
| Password                                     | Password used for the Hardware Management Console                                    |

## Advanced configuration

| Field                         | Description                                                    |
|-------------------------------|----------------------------------------------------------------|
| Inventory Poll Interval (min) | Interval between inventory polls. The default is 20 minutes.   |
| SSH Port                      | Port used for SSH to the PowerVM                               |
| Password                      | Password used for the Hardware Management Console              |
| Number of Retries             | Number of inventory retry attempts                             |
| Exclude Devices               | Comma-separated list of device IDs or display names to exclude |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Configuring the IBM SAN Volume Controller data collector

The IBM SAN Volume Controller (SVC) data collector collects inventory and performance data using SSH, supporting a variety of devices that run the SVC operating system.

The list of supported devices includes models such as the SVC, the v7000, the v5000, and the v3700. Refer to the Cloud Insights support matrix for supported models and firmware versions.

## Terminology

Cloud Insights acquires the following inventory information from the IBM SVC data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term    |
|-------------------|------------------------|
| Drive             | Disk                   |
| Cluster           | Storage                |
| Node              | Storage Node           |
| Mdisk Group       | Storage Pool           |
| Vdisk             | Volume                 |
| Mdisk             | Backend LUNs and paths |

Note: These are common terminology mappings only and might not represent every case for this data collector.

### Inventory Requirements

- IP address of each SVC cluster
- Port 22 available
- Read-only user name and password

### Performance Requirements

- SVC Console, which is mandatory for any SVC cluster and required for the SVC discovery foundation package.
- Credentials will require administrative access level only for copying performance files from cluster nodes to the config node.
- Enable data collection by connecting to the SVC cluster by SSH and running: `svctask startstats -interval 1`

Note: Alternatively, enable data collection using the SVC management user interface.

### Configuration

| Field                | Description                                                     |
|----------------------|-----------------------------------------------------------------|
| Cluster IP Addresses | IP addresses or fully-qualified domain names of the SVC storage |
| Inventory User Name  | User name for the SVC CLI                                       |
| Inventory Password   | Password for the SVC CLI                                        |

### Advanced configuration

| Field                           | Description                                                     |
|---------------------------------|-----------------------------------------------------------------|
| Inventory Poll Interval (min)   | Interval between inventory polls. The default is 40 minutes.    |
| Performance Poll Interval (sec) | Interval between performance polls. The default is 300 seconds. |
| To clean up dumped stats files  | Select this checkbox to clean up dumped stats files             |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

| Problem:                                                                                   | Try this:                                               |
|--------------------------------------------------------------------------------------------|---------------------------------------------------------|
| Error: "The command cannot be initiated because it was not run on the configuration node." | The command must be executed on the configuration node. |

Some things to try if you encounter problems with this data collector:

| Problem:                                                                                   | Try this:                                               |
|--------------------------------------------------------------------------------------------|---------------------------------------------------------|

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Configuring the IBM XIV/A9000 data collector

IBM XIV and A9000 (CLI) data collector uses the XIV command-line interface to collect inventory data while performance collection is accomplished by making SMI-S calls to the XIV/A9000 array, which runs a SMI-S provider on port 7778.

### Terminology

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Disk              | Disk                |
| Storage System    | Storage             |
| Storage Pool      | Storage Pool        |
| Volume            | Volume              |

### Requirements

The following requirements must be met to configure and use this data collector:

- Port requirement: TCP port 7778
- Read-only user name and password
- The XIV CLI must be installed on the AU

### Performance requirements

The following are requirements for performance collection:

- SMI-S Agent 1.4 or higher
- SMI-S compatible CIMService running on array. Most XIV arrays have a CIMServer installed by default.
- User login must be provided for the CIMServer. The login must have full read access to the array configuration and properties.

- SMI-S namespace. Default is root/ibm. This is configurable in the CIMServer.
- Port Requirements: 5988 for HTTP, 5989 for HTTPS.
- Refer to the following link on how to create an account for SMI-S performance collection:  
[http://publib.boulder.ibm.com/infocenter/tivihelp/v4r1/index.jsp?topic=%2Fcom.ibm.tpc\\_V41.doc%2Ffqz0\\_t\\_adding\\_cim\\_agent.html](http://publib.boulder.ibm.com/infocenter/tivihelp/v4r1/index.jsp?topic=%2Fcom.ibm.tpc_V41.doc%2Ffqz0_t_adding_cim_agent.html)

## Configuration

| Field                          | Description                                                  |
|--------------------------------|--------------------------------------------------------------|
| XIV IP address                 | IP address or fully-qualified domain name of the XIV storage |
| User Name                      | User name for the XIV storage                                |
| Password                       | Password for the XIV storage                                 |
| Full Path to XIV CLI Directory | Full path to the folder containing the XIV CLI               |
| SMI-S Host IP Address          | IP address of the SMI-S host                                 |

## Advanced configuration

| Field                           | Description                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------|
| Inventory Poll Interval (min)   | Interval between inventory polls. The default is 40 minutes.                                            |
| SMI-S Protocol                  | Protocol used to connect to the SMI-S provider. Also displays the default port.                         |
| Override SMI-S Port             | If blank, use the default port in the Connection Type field, otherwise enter the connection port to use |
| Username                        | User name for the SMI-S Provider Host                                                                   |
| Password                        | Password for the SMI-S Provider Host                                                                    |
| Performance Poll Interval (sec) | Interval between performance polls. The default is 300 seconds.                                         |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Lenovo data collector

Cloud Insights uses the Lenovo data collector to discover inventory and performance data for Lenovo HX storage systems.

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- Prism External IP Address
- Administrator user name and password
- TCP Port requirement: 9440

## Configuration

| Field                     | Description                                           |
|---------------------------|-------------------------------------------------------|
| Prism External IP Address | The external data services IP address for the cluster |
| User name                 | User name for the Admin account                       |
| Password                  | Password for the Admin account                        |

## Advanced configuration

| Field                           | Description                                                     |
|---------------------------------|-----------------------------------------------------------------|
| TCP port                        | TCP Port used to connect to array. The default is 9440.         |
| Inventory poll interval (min)   | Interval between inventory polls. The default is 60 minutes.    |
| Performance poll interval (sec) | Interval between performance polls. The default is 300 seconds. |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

# Microsoft

## Configuring the Azure NetApp Files data collector

Cloud Insights uses the Azure NetApp Files data collector to acquire inventory and performance data.

## Requirements

You need the following information to configure this data collector.

- Port requirement: 443 HTTPS
- Azure Management Rest IP (management.azure.com)
- Azure service principal client ID (user account)
- Azure service principal authentication key (user password)
- You need to set up an Azure account for Cloud Insights discovery.

Once the account is properly configured and you register the application in Azure, you will have the credentials required to discover the Azure instance with Cloud Insights. The following link describes how to set up the account for discovery:

<https://docs.microsoft.com/en-us/azure/active-directory/develop/howto-create-service-principal-portal>

## Configuration

Enter data into the data collector fields according to the table below:

| Field                                            | Description                                                                                                |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Azure Service Principal Client ID                | Sign-in ID to Azure                                                                                        |
| Azure Tenant ID                                  | Azure Tenant ID                                                                                            |
| Azure Service Principal Authentication Key       | Login authentication key                                                                                   |
| I understand Microsoft bills me for API requests | Check this to verify your understanding that Microsoft bills you for API requests made by Insight polling. |

## Advanced Configuration

| Field                         | Description       |
|-------------------------------|-------------------|
| Inventory Poll Interval (min) | The default is 60 |

## Troubleshooting

- The credentials used by your ANF data collector must not have access to any Azure subscriptions that contain ANF volumes.
- If Reader access causes performance collection to fail, try granting contributor access on a resource group level.

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Microsoft Hyper-V data collector

The Microsoft Hyper-V data collector acquires inventory and performance data from the virtualized server computing environment.

## Terminology

Cloud Insights acquires the following inventory information from the Microsoft Hyper-V (WMI). For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Virtual Hard Disk | Virtual Disk        |
| Host              | Host                |
| Virtual Machine   | Virtual Machine     |

| Vendor/Model Term                              | Cloud Insights Term |
|------------------------------------------------|---------------------|
| Cluster Shared Volumes (CSV), Partition Volume | Data Store          |
| Internet SCSI Device, Multi Path SCSI LUN      | LUN                 |
| Fiber Channel Port                             | Port                |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

The following are required to configure this data collector:

- The Hyper-V requires port 5985 opened for data collection and remote access/management.
- IP address of Clustering group node
- Local Administrator user & password on the hypervisor
- Administrative-level user account
- Windows Management Instrumentation (WMI) command, which is the default that is installed by Windows.
- Port requirements: Port 135 via WMI & Dynamic TCP ports assigned 1024-65535 for Windows 2003 and older and 49152-65535 for Windows 2008.
- DNS resolution must succeed, even if the data collector is pointed at only an IP address
- Each Hyper-V hypervisor must have “Resource Metering” turned on for every VM, on every host. This allows each hypervisor to have more data available for Cloud Insights on each guest. If this is not set, fewer performance metrics are acquired for each guest. More information on Resource metering can be found in the microsoft documentation:

[Hyper-V Resource Metering Overview](#)

[Enable-VMResourceMetering](#)

The Hyper-V data collector requires a Windows Acquisition Unit.

## Configuration

| Field                    | Description                                                                      |
|--------------------------|----------------------------------------------------------------------------------|
| Physical Host IP Address | The IP address or fully-qualified domain name for the physical host (hypervisor) |
| User Name                | Administrator user name for the hypervisor                                       |
| Password                 | Password for the hypervisor                                                      |
| NT Domain                | The DNS name used by the nodes in the cluster                                    |

## Advanced configuration

| Field                         | Description                |
|-------------------------------|----------------------------|
| Inventory Poll Interval (min) | The default is 20 minutes. |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

# NetApp

## NetApp Cloud Connection for ONTAP 9.9+ data collector

This data collector creates a cloud connection to support data collection from ONTAP 9.9+ CVO, AFF, and FAS systems.

This data collector is [deprecated](#) as of January 1, 2023. For information on transitioning to AU-based data collection, see the [Knowledgebase](#).

## Configuration

Cloud Insights collects data from ONTAP 9.9+ using a **cloud connection**, eliminating the need to install an external acquisition unit, simplifying troubleshooting, maintenance, and initial deployment. Configuration of the cloud connection for the ONTAP 9.9+ data collector requires you to copy a **Pairing Code** to the ONTAP System Manager, which will then establish a connection to your Cloud Insights environment. After the connection is established, the data collected is the same as it would be if it was collected through an acquisition unit.

This data collector supports ONTAP 9.9+ CVO, AFF, and FAS systems.

Cloud Connection for ONTAP 9.9+

### Configure Collector

Quickly add a cloud connection in your environment and immediately start monitoring data

#### Connect to ONTAP 9.9+ via a Cloud Connection

[Need Help?](#)

- 1 [Generate Token](#)
- 2 [Copy Pairing Code](#)
- 3 In a new tab, login to **ONTAP System Manager (SM)** for the cluster you would like to monitor and navigate to Cluster > Settings > Cloud Connections.
- 4 Click on **Add Cloud Connection** and paste the Pairing Code from step 2.
- 5 The connection will be established automatically with no additional user interaction. Check System Manager for error messages if connection is not established after a few minutes.

Follow these steps to configure the connection:

- Generate a unique token which will be used to establish the connection to the ONTAP system.
- Copy the Pairing Code, which includes the token. You can view the pairing code by clicking on [\[+\] Reveal Code Snippet](#).

Once you copy the pairing code, the data collector configuration screen will reveal a step 6, prompting you to wait for the connection to be established. Nothing more needs to be done on this screen until the connection is established.

- In a new browser tab, log into the ONTAP System Manager and navigate to *Cluster > Settings > Cloud Connections*.
- Click *Add Cloud Connection* and paste the pairing code.
- Return to the Cloud Insights browser tab and wait for the connection to be established. Once it is established, a *Complete* button is revealed.
- Click *Complete*.

## Troubleshooting

Some things to try if you encounter problems with this data collector:

| Problem:                                                                                                                                               | Try this:                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I'm seeing the following error while trying to connect to Azure CVO: "The certificate signing request to broker/manager CA service was not completed." | Verify that your Cloud manager proxy settings are set to the Cloud Manager private IP. Cloud Manager installation may set a different proxy. Once the proxy is set to the correct IP and you reference the proxy in the Cloud Connector dialog, the connection to Cloud Insights should connect successfully. |

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## NetApp Cloud Volumes ONTAP data collector

This data collector supports inventory collection from Cloud Volumes ONTAP configurations.

### Configuration

| Field                        | Description                         |
|------------------------------|-------------------------------------|
| NetApp Management IP Address | IP address for Cloud Volumens ONTAP |
| User Name                    | User name for Cloud Volumes ONTAP   |
| Password                     | Password for the above user         |

### Advanced configuration

| Field                       | Description                                 |
|-----------------------------|---------------------------------------------|
| Connection Type             | HTTPS recommended. Also shows default port. |
| Override Communication Port | Port to use if not default.                 |

| Field                               | Description                                                                         |
|-------------------------------------|-------------------------------------------------------------------------------------|
| Inventory Poll Interval (min)       | Default is 60 minutes.                                                              |
| Inventory Concurrent Thread Count   | Number of concurrent threads.                                                       |
| Force TLS for HTTPS                 | Force TLS over HTTPS                                                                |
| Automatically Lookup Netgroups      | Automatically Lookup Netgroups                                                      |
| Netgroup Expansion                  | Select Shell or File                                                                |
| HTTP read timeout seconds           | Default is 30 seconds                                                               |
| Force responses as UTF-8            | Force responses as UTF-8                                                            |
| Performance Poll Interval (min)     | Default is 900 seconds.                                                             |
| Performance Concurrent Thread Count | Number of concurrent threads.                                                       |
| Advanced Counter Data Collection    | Check this to have Cloud Insights collect the advanced metrics from the list below. |

## Troubleshooting

| Inventory Poll Interval (min) | Default is 60 minutes |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

| Problem:                                                                                                                                                                                                                                                                                                                                                                         | Try this:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>I received an error similar to this one:<br/> 'Failed to execute request: Connect to &lt;AWS region endpoint&gt;:8080 [&lt;AWS region endpoint&gt;/AWS region endpoint IP&gt;] failed: connect timed out: GET <a href="https://&lt;AWS Region Endpoint FQDN&gt;:8080/v1/Storage/IPRanges">https://&lt;AWS Region Endpoint FQDN&gt;:8080/v1/Storage/IPRanges</a> HTTP/1.1'</p> | <p>The <a href="#">proxy</a> used by Cloud Insights to communicate with the Acquisition Unit does not communicate between Cloud Insights and the Data Collector itself. Here are a few things you can try:</p> <p>Ensure that the acquisition unit is able to resolve the fqdn and reach the required port.<br/> Confirm that a proxy is not required to reach the specified endpoint in the error message.<br/> Curl can be used to test the communication between the acquisition unit and the endpoint. Make sure that you are <b>not</b> using a Proxy for this test.</p> <p>Example:</p> <pre>root@acquisitionunit# curl -s -H accept:application/json -H "Content-type: application/json" -H api-key:&lt;api key used in the data collector credentials -H secret-key:&lt;secret key used in the data collector credentials&gt; -X GET <a href="https://&lt;AWS Regional Endpoint&gt;:8080/v1/Storage/IPRanges">https://&lt;AWS Regional Endpoint&gt;:8080/v1/Storage/IPRanges</a></pre> <p>See this <a href="#">NetApp KB article</a>.</p> |

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## NetApp Config Advisor data collector

This data collector acquires configuration data from storage systems running ONTAP and connected switches using read-only calls. This data collector also runs configuration validation and health checks on the whole stack of ONTAP cluster configuration to identify cabling, configuration, resiliency, availability and security issues.

This data collector is [deprecated](#).

## Terminology

Cloud Insights acquires configuration data from ONTAP and switches with the Config Advisor data collector. For each asset type acquired, the most common terminology used for the asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Disk              | Disk                |
| Switch            | Switch              |
| Cluster           | Storage             |
| Node              | Storage Node        |

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Aggregate         | Storage Pool        |
| LUN               | Volume              |
| Volume            | Internal Volume     |

In addition, note that Config Advisor metrics will be available in dashboard and other queries with the *netapp\_ontap.configadvisor* tag.

## Config Advisor Terminology

The following terms apply to objects or references that you might find on Config Advisor dashboards.

### Device Summary

- Model – A comma-delimited list of the unique, discrete node model names within this cluster. If all the nodes in the clusters are the same model type, just one model name will appear.
- Device Type/Type – type of the device in data source – Storage Controller/Switch
- Vendor/Subtype – same Vendor name you would see if you were configuring a new data source.
- Serial number – The array serial number. On cluster architecture storage systems like ONTAP Data Management, this serial number may be less useful than the individual “Storage Nodes” serial numbers.
- Hostname –hostname(s) as configured in the data source.
- Version – OS or firmware version.

### Rule Results

- Rule – A check that is run against the system analysing deviation in configuration from recommended practices or identifying known issues.
- Rule Name – short name for the rule or check that is run.
- Rule ID – identifier for the rule.
- Target – component on which the rule is applied. It would be cluster name, node name or switch name.
- Impact – Impact of the risk on the system. Impact levels are categorized as below
  - High Impact: Potential loss of data access or prolonged loss of node redundancy
  - Medium Impact: Performance degradation or short-term loss of node redundancy.
  - Low Impact: Low impact scenarios
  - Best Practice: Deviations from documented Best Practices
- Description – Brief description of the error.
- Details – detailed description of the error listing the components impacted
  - Recommendations – Links to KB articles or NetApp documentation providing additional details on the

risk or remediation.

## Requirements

The following are requirements to configure and use this data collector:

- You must have access to an administrator account configured for read-only access for SSH and ONTAPI calls on ONTAP.
- You must have access to an administrator account configured for read-only access for SSH calls on switches if they are part of collection
- Account details include username and password. Optionally can pass the SSH private key if ONTAP is configured for SSH key based authentication or Multi Factor Authentication (MFA)
- Port requirements: 22, 80 or 443
- Account permissions:
  - Read only role name to ssh or/and ontapi application to the default Vserver
  - Admin account with at least read-only permission on switches

## Configuration

| Field                | Description                                                     |
|----------------------|-----------------------------------------------------------------|
| NetApp Management IP | IP address or fully-qualified domain name of the NetApp cluster |
| User Name            | User name for NetApp cluster                                    |
| Password             | Password for NetApp cluster                                     |

## Advanced configuration

| Field                | Description                                                                       |
|----------------------|-----------------------------------------------------------------------------------|
| Enable MFA for ONTAP | Check this to enable Multi-Factor Authentication on ONTAP                         |
| SSH Private Key      | Paste the SSH private key content if ONTAP is using SSH key authentication or MFA |
| Connection type      | Choose HTTP (default port 80) or HTTPS (default port 443). The default is HTTPS   |
| ONTAP SSH Port       | Allows to specify custom SSH port for ONTAP connection                            |
| Switch SSH Port      | Allows to specify custom SSH port for Switch connection                           |
| Poll Interval (min)  | Default is 1440 minutes or 24 hours. Can set minimum up to 60 min                 |

## Supported Operating Systems

Config Advisor can run on following operating systems. If collector is installed on an Acquisition Unit with Operating System not in this list, collections would fail.

- Windows 10 (64-bit)
- Windows 2012 R2 Server (64-bit)
- Windows 2016 Server (64-bit)
- Windows 2019 Server (64-bit)
- Red Hat Enterprise Linux (RHEL) 7.7 and later (64-bit)
- Ubuntu 14.0 and later

## Support and Video

Watch these videos to learn how to install the data collector and use dashboards to get the most out of Config Advisor in Cloud Insights:

### Installing and configuring the data collector:

 | [Installing and Configuring the Config Advisor data collector](#)

### Creating a Config Advisor dashboard:

 | [Using dashboards to view Config Advisor data](#)

### Other support

For other questions associated with Config Advisor, open a ticket from the Config Advisor Tool by clicking on Help → Open Support Ticket.

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## NetApp ONTAP Data Management Software data collector

This data collector acquires inventory and performance data from storage systems running ONTAP using read-only API calls from an ONTAP account. This data collector also creates a record in the cluster application registry to accelerate support.

### Terminology

Cloud Insights acquires inventory and performance data from the ONTAP data collector. For each asset type acquired, the most common terminology used for the asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Disk              | Disk                |
| Raid Group        | Disk Group          |
| Cluster           | Storage             |
| Node              | Storage Node        |
| Aggregate         | Storage Pool        |
| LUN               | Volume              |
| Volume            | Internal Volume     |

## ONTAP Data Management Terminology

The following terms apply to objects or references that you might find on ONTAP Data Management storage asset landing pages. Many of these terms apply to other data collectors as well.

### Storage

- **Model** – A comma-delimited list of the unique, discrete node model names within this cluster. If all the nodes in the clusters are the same model type, just one model name will appear.
- **Vendor** – same Vendor name you would see if you were configuring a new data source.
- **Serial number** – The array serial number. On cluster architecture storage systems like ONTAP Data Management, this serial number may be less useful than the individual “Storage Nodes” serial numbers.
- **IP** – generally will be the IP(s) or hostname(s) as configured in the data source.
- **Microcode version** – firmware.
- **Raw Capacity** – base 2 summation of all the physical disks in the system, regardless of their role.
- **Latency** – a representation of what the host facing workloads are experiencing, across both reads and writes. Ideally, Cloud Insights is sourcing this value directly, but this is often not the case. In lieu of the array offering this up, Cloud Insights is generally performing an IOPs-weighted calculation derived from the individual internal volumes’ statistics.
- **Throughput** – aggregated from internal volumes.
- **Management** – this may contain a hyperlink for the management interface of the device. Created programmatically by the Cloud Insights data source as part of inventory reporting.

### Storage Pool

- **Storage** – what storage array this pool lives on. Mandatory.
- **Type** – a descriptive value from a list of an enumerated list of possibilities. Most commonly will be “Aggregate” or “RAID Group”.
- **Node** – if this storage array’s architecture is such that pools belong to a specific storage node, its name will be seen here as a hyperlink to its own landing page.
- **Uses Flash Pool** – Yes/No value – does this SATA/SAS based pool have SSDs used for caching acceleration?
- **Redundancy** – RAID level or protection scheme. RAID\_DP is dual parity, RAID\_TP is triple parity.
- **Capacity** – the values here are the logical used, usable capacity and the logical total capacity, and the percentage used across these.
- **Over-committed capacity** – If by using efficiency technologies you have allocated a sum total of volume or internal volume capacities larger than the logical capacity of the storage pool, the percentage value here will be greater than 0%.
- **Snapshot** – snapshot capacities used and total, if your storage pool architecture dedicates part of its capacity to segments areas exclusively for snapshots. ONTAP in MetroCluster configurations are likely to exhibit this, while other ONTAP configurations are less so.
- **Utilization** – a percentage value showing the highest disk busy percentage of any disk contributing capacity to this storage pool. Disk utilization does not necessarily have a strong correlation with array performance – utilization may be high due to disk rebuilds, deduplication activities, etc in the absence of host driven workloads. Also, many arrays’ replication implementations may drive disk utilization while not showing as internal volume or volume workload.
- **IOPS** – the sum IOPs of all the disks contributing capacity to this storage pool.

Throughput – the sum throughput of all the disks contributing capacity to this storage pool.

### Storage Node

- Storage – what storage array this node is part of. Mandatory.
- HA Partner – on platforms where a node will fail over to one and only one other node, it will generally be seen here.
- State – health of the node. Only available when the array is healthy enough to be inventoried by a data source.
- Model – model name of the node.
- Version – version name of the device.
- Serial number – The node serial number.
- Memory – base 2 memory if available.
- Utilization – On ONTAP, this is a controller stress index from a proprietary algorithm. With every performance poll, a number between 0 and 100% will be reported that is the higher of either WAFL disk contention, or average CPU utilization. If you observe sustained values > 50%, that is indicative of undersizing – potentially a controller/node not large enough or not enough spinning disks to absorb the write workload.
- IOPS – Derived directly from ONTAP ZAPI calls on the node object.
- Latency – Derived directly from ONTAP ZAPI calls on the node object.
- Throughput – Derived directly from ONTAP ZAPI calls on the node object.
- Processors – CPU count.

### Requirements

The following are requirements to configure and use this data collector:

- You must have access to an Administrator account configured for read-only API calls.
- Account details include username and password.
- Port requirements: 80 or 443
- Account permissions:
  - Read only role name to ontapi application to the default Vserver
  - You may require additional optional write permissions. See the Note About Permissions below.
- ONTAP License requirements:
  - FCP license and mapped/masked volumes required for fibre-channel discovery

### Configuration

| Field                | Description                                                     |
|----------------------|-----------------------------------------------------------------|
| NetApp Management IP | IP address or fully-qualified domain name of the NetApp cluster |
| User Name            | User name for NetApp cluster                                    |
| Password             | Password for NetApp cluster                                     |

## Advanced configuration

| Field                            | Description                                                                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Connection type                  | Choose HTTP (default port 80) or HTTPS (default port 443). The default is HTTPS                                                   |
| Override Communication Port      | Specify a different port if you do not want to use the default                                                                    |
| Inventory Poll Interval (min)    | Default is 60 minutes.                                                                                                            |
| For TLS for HTTPS                | Only allow TLS as protocol when using HTTPS                                                                                       |
| Automatically Lookup Netgroups   | Enable the automatic netgroup lookups for export policy rules                                                                     |
| Netgroup Expansion               | Netgroup Expansion Strategy. Choose <i>file</i> or <i>shell</i> . The default is <i>shell</i> .                                   |
| HTTP read timeout seconds        | Default is 30                                                                                                                     |
| Force responses as UTF-8         | Forces data collector code to interpret responses from the CLI as being in UTF-8                                                  |
| Performance Poll Interval (sec)  | Default is 900 seconds.                                                                                                           |
| Advanced Counter Data Collection | Enable ONTAP integration. Select this to include ONTAP Advanced Counter data in polls. Choose the desired counters from the list. |

### A Note About Permissions

Since a number of Cloud Insights' ONTAP dashboards rely on advanced ONTAP counters, you must enable **Advanced Counter Data Collection** in the data collector Advanced Configuration section.

You should also ensure that write permission to the ONTAP API is enabled. This typically requires an account at the cluster level with the necessary permissions.

To create a local account for Cloud Insights at the cluster level, log in to ONTAP with the Cluster management Administrator username/password, and execute the following commands on the ONTAP server:

1. Before you begin, you must be signed in to ONTAP with an *Administrator* account, and *diagnostic-level commands* must be enabled.
2. Create a read-only role using the following commands.

```
security login role create -role ci_readonly -cmddirname DEFAULT -access  
readonly  
security login role create -role ci_readonly -cmddirname security  
-access readonly  
security login role create -role ci_readonly -access all -cmddirname  
{cluster application-record create}
```

3. Create the read-only user using the following command. Once you have executed the create command, you will be prompted to enter a password for this user.

```
security login create -username ci_user -application ontapi
-authentication-method password -role ci_readonly
```

If AD/LDAP account is used, the command should be

```
security login create -user-or-group-name DOMAIN\aduser/adgroup
-application ontapi -authentication-method domain -role ci_readonly
```

The resulting role and user login will look something like the following. Your actual output may vary:

```
Role Command/ Access
Vserver Name Directory Query Level
-----
cluster1 ci_readonly DEFAULT read only
cluster1 ci_readonly security readonly
```

```
cluster1::security login> show
Vserver: cluster1
Authentication Acct
UserName      Application      Method      Role Name      Locked
-----
ci_user       ontapi          password    ci_readonly    no
```

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                                           | Try this:                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Receive 401 HTTP response or 13003 ZAPI error code and ZAPI returns "Insufficient privileges" or "not authorized for this command" | Check username and password, and user privileges/permissions.                                                        |
| Cluster version is < 8.1                                                                                                           | Cluster minimum supported version is 8.1. Upgrade to minimum supported version.                                      |
| ZAPI returns "cluster role is not cluster_mgmt LIF"                                                                                | AU needs to talk to cluster management IP. Check the IP and change to a different IP if necessary                    |
| Error: "7 Mode filers are not supported"                                                                                           | This can happen if you use this data collector to discover 7 mode filer. Change IP to point to cdot cluster instead. |

| Problem:                                                                                                                                                                                                                                                                                                                                          | Try this:                                                                                                                                                               |

| ZAPI command fails after retry                                                                                                                                                                                                                                                                                                                    | AU has communication problem with the cluster. Check network, port number, and IP address. User should also try to run a command from command line from the AU machine. |
| AU failed to connect to ZAPI via HTTP                                                                                                                                                                                                                                                                                                             | Check whether ZAPI port accepts plaintext. If AU tries to send plaintext to an SSL socket, the communication fails.                                                     |
| Communication fails with SSLException                                                                                                                                                                                                                                                                                                             | AU is attempting to send SSL to a plaintext port on a filer. Check whether the ZAPI port accepts SSL, or use a different port.                                          |
| <p>Additional Connection errors:</p> <p>ZAPI response has error code 13001, “database is not open”</p> <p>ZAPI error code is 60 and response contains “API did not finish on time”</p> <p>ZAPI response contains “initialize_session() returned NULL environment”</p> <p>ZAPI error code is 14007 and response contains “Node is not healthy”</p> | Check network, port number, and IP address. User should also try to run a command from command line from the AU machine.                                                |

## Performance

| Problem:                                        | Try this:                                                                                                                                                                                          |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| “Failed to collect performance from ZAPI” error | <p>This is usually due to perf stat not running. Try the following command on each node:</p> <pre>&gt; system node systemshell -node * -command "spmctl -h cmd --stop; spmctl -h cmd --exec"</pre> |

Additional information may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## NetApp Data ONTAP operating in 7-Mode data collector

For storage systems using Data ONTAP software operating in 7-Mode, you use the 7-mode data collector, which uses the CLI to obtain capacity and performance data.

### Terminology

Cloud Insights acquires the following inventory information from the NetApp 7-mode data collector. For each asset type acquired, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

This data collector is [deprecated](#).

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Disk              | Disk                |
| Raid Group        | Disk Group          |
| Filer             | Storage             |
| Filer             | Storage Node        |
| Aggregate         | Storage Pool        |
| LUN               | Volume              |
| Volume            | Internal Volume     |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

You need the following to configure and use this data collector:

- IP addresses of the FAS storage controller and partner.
- Port 443
- A custom admin level username and password for controller and partner controller with the following role capabilities for 7-Mode:
  - "api-\*": Use this to allow OnCommand Insight to execute all NetApp storage API commands.
  - "login-http-admin": Use this to allow OnCommand Insight to connect to the NetApp storage via HTTP.
  - "security-api-vfiler": Use this to allow OnCommand Insight to execute NetApp storage API commands to retrieve vFiler unit information.
  - "cli-options": Use this to read storage system options.
  - "cli-lun": Access these commands for managing LUNs. Displays the status (LUN path, size, online/offline state, and shared state) of the given LUN or class of LUNs.
  - "cli-df": Use this to display free disk space.
  - "cli-ifconfig": Use this to display interfaces and IP addresses.

## Configuration

| Field                                   | Description                                                             |
|-----------------------------------------|-------------------------------------------------------------------------|
| Address of storage system               | IP address or fully-qualified domain name for the NetApp storage system |
| User Name                               | User name for the NetApp storage system                                 |
| Password                                | Password for the NetApp storage system                                  |
| Address of HA Partner in Cluster        | IP address or fully-qualified domain name for the HA Partner            |
| User Name of HA Partner in Cluster      | User name for the HA partner                                            |
| Password of HA Partner Filer in Cluster | Password for the HA Partner                                             |

## Advanced configuration

| Field                           | Description                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------|
| Inventory Poll Interval (min)   | Interval between inventory polls. The default is 20 minutes.                                            |
| Connection Type                 | HTTPS or HTTP, also displays the default port                                                           |
| Override Connection Port        | If blank, use the default port in the Connection Type field, otherwise enter the connection port to use |
| Performance Poll Interval (sec) | Interval between performance polls. The default is 300 seconds.                                         |

## Storage systems connection

As an alternative to using the default administrative user for this data collector, you can configure a user with administrative rights directly on the NetApp storage systems so that this data collector can acquire data from NetApp storage systems.

Connecting to NetApp storage systems requires that the user, who is specified when acquiring the main pfiler (on which the storage system exist), meet the following conditions:

- The user must be on vfiler0 (root filer/pfiler).

Storage systems are acquired when acquiring the main pfiler.

- The following commands define the user role capabilities:

- "api-\*": Use this to allow Cloud Insights to execute all NetApp storage API commands.

This command is required to use the ZAPI.

- "login-http-admin": Use this to allow Cloud Insights to connect to the NetApp storage via HTTP. This command is required to use the ZAPI.
- "security-api-vfiler": Use this to allow Cloud Insights to execute NetApp storage API commands to retrieve vFiler unit information.
- "cli-options": For "options" command and used for partner IP and enabled licenses.
- "cli-lun": Access these command for managing LUNs. Displays the status (LUN path, size, online/offline state, and shared state) of the given LUN or class of LUNs.
- "cli-df": For "df -s", "df -r", "df -A -r" commands and used to display free space.
- "cli-ifconfig": For "ifconfig -a" command and used for getting filer IP address.
- "cli-rdfile": For "rdfile /etc/netgroup" command and used for getting netgroups.
- "cli-date": For "date" command and used to get full date for getting Snapshot copies.
- "cli-snap": For "snap list" command and used for getting Snapshot copies.

If cli-date or cli-snap permissions are not provided, acquisition can finish, but Snapshot copies are not reported.

To acquire a 7-Mode data source successfully and generate no warnings on the storage system, you should use one of the following command strings to define your user roles. The second string listed here is a streamlined version of the first:

- login-http-admin,api-\*,security-api-vfile,cli-rdfile,cli-options,cli-df,cli-lun,cli-ifconfig,cli-date,cli-snap,\_,
- login-http-admin,api-\*,security-api-vfile,cli-

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                                           | Try this:                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Receive 401 HTTP response or 13003 ZAPI error code and ZAPI returns “Insufficient privileges” or “not authorized for this command” | Check username and password, and user privileges/permissions.                                                                                                                                                                                                                                                                                                                                                                                                           |
| “Failed to execute command” error                                                                                                  | Check whether the user has the following permission on the device: <ul style="list-style-type: none"> <li>• api-*</li> <li>• cli-date</li> <li>• cli-df</li> <li>• cli-ifconfig</li> <li>• cli-lun</li> <li>• cli-operations</li> <li>• cli-rdfile</li> <li>• cli-snap</li> <li>• login-http-admin</li> <li>• security-api-vfiler</li> </ul> Also check if the ONTAP version is supported by Cloud Insights and verify if the credentials used match device credentials |
| Cluster version is < 8.1                                                                                                           | Cluster minimum supported version is 8.1. Upgrade to minimum supported version.                                                                                                                                                                                                                                                                                                                                                                                         |
| ZAPI returns "cluster role is not cluster_mgmt LIF"                                                                                | AU needs to talk to cluster management IP. Check the IP and change to a different IP if necessary                                                                                                                                                                                                                                                                                                                                                                       |
| Error: “7 Mode filers are not supported”                                                                                           | This can happen if you use this data collector to discover 7 mode filer. ## NetApp E-Series data collector

The NetApp E-Series data collector gathers inventory and performance data. The collector supports firmware 7.x+ using the same configurations and reporting the same data.

### Terminology

Cloud insight acquires the following inventory information from the NetApp E-Series data collector. For each asset type acquired, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| <b>Vendor/Model Term</b> | <b>Cloud Insights Term</b> |
|--------------------------|----------------------------|
| Disk                     | Disk                       |
| Volume Group             | Disk Group                 |
| Storage Array            | Storage                    |
| Controller               | Storage Node               |
| Volume Group             | Storage Pool               |
| Volume                   | Volume                     |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## E-Series Terminology (Landing Page)

The following terms apply to objects or references that you might find on NetApp E-Series asset landing pages. Many of these terms apply to other data collectors as well.

### Storage

- Model – model name of the device.
- Vendor – same Vendor name you would see if you were configuring a new datasource
- Serial number – The array serial number. On cluster architecture storage systems like NetApp Clustered Data Ontap, this serial number may be less useful than the individual “Storage Nodes” serial numbers
- IP – generally will be the IP(s) or hostname(s) as configured in the data source
- Microcode version – firmware
- Raw Capacity – base 2 summation of all the physical disks in the system, regardless of their role
- Latency – a representation of what the host facing workloads are experiencing, across both reads and writes. Ideally, Cloud Insights is sourcing this value directly, but this is often not the case. In lieu of the array offering this up, Cloud Insights is generally performing an IOPs-weighted calculation derived from the individual volumes’ statistics.
- Throughput – the array’s total host facing throughput. Ideally sourced directly from the array, if unavailable, Cloud Insights is summing the volumes’ throughput to derive this value
- Management – this may contain a hyperlink for the management interface of the device. Created programmatically by the Cloud Insights datasource as part of inventory reporting

### Storage Pool

- Storage – what storage array this pool lives on. Mandatory
- Type – a descriptive value from a list of an enumerated list of possibilities. Most commonly will be “Thin Provisioning” or “RAID Group”
- Node – if this storage array’s architecture is such that pools belong to a specific storage node, its name will be seen here as a hyperlink to its own landing page
- Uses Flash Pool – Yes/No value
- Redundancy – RAID level or protection scheme. E-Series reports “RAID 7” for DDP pools
- Capacity – the values here are the logical used, usable capacity and the logical total capacity, and the percentage used across these. These value both include E-Series “preservation” capacity, resulting both in numbers and the percentage being higher than what the E-Series own user interface may show
- Over-committed capacity – If via efficiency technologies you have allocated a sum total of volume or internal volume capacities larger than the logical capacity of the storage pool, the percentage value here will be greater than 0%.
- Snapshot – snapshot capacities used and total, if your storage pool architecture dedicates part of its capacity to segments areas exclusively for snapshots
- Utilization – a percentage value showing the highest disk busy percentage of any disk contributing capacity to this storage pool. Disk utilization does not necessarily have a strong correlation with array performance – utilization may be high due to disk rebuilds, deduplication activities, etc in the absence of host driven

workloads. Also, many arrays' replication implementations may drive disk utilization while not showing as volume workload.

- IOPS – the sum IOPs of all the disks contributing capacity to this storage pool. If disk IOPs is not available on a given platform, this value will be sourced from the sum of volume IOPs for all the volumes sitting on this storage pool
- Throughput – the sum throughput of all the disks contributing capacity to this storage pool. If disk throughput is not available on a given platform, this value will be sourced from the sum of volume throughput for all the volumes sitting on this storage pool

### Storage Node

- Storage – what storage array this node is part of. Mandatory
- HA Partner – on platforms where a node will fail over to one and only one other node, it will generally be seen here
- State – health of the node. Only available when the array is healthy enough to be inventoried by a data source
- Model – model name of the node
- Version – version name of the device.
- Serial number – The node serial number
- Memory – base 2 memory if available
- Utilization – Generally a CPU utilization number, or in the case of NetApp Ontap, a controller stress index. Utilization is not currently available for NetApp E-Series
- IOPS – a number representing the host driven IOPs on this controller. Ideally sourced directly from the array, if unavailable, it will be calculated by summing all the IOPs for volumes that belong exclusively to this node.
- Latency – a number representing the typical host latency or response time on this controller. Ideally sourced directly from the array, if unavailable, it will be calculated by performing an IOPs weighted calculation from volumes that belong exclusively to this node.
- Throughput – a number representing the host driven throughput on this controller. Ideally sourced directly from the array, if unavailable, it will be calculated by summing all the throughput for volumes that belong exclusively to this node.
- Processors – CPU count

### Requirements

- The IP address of each controller on the array
- Port requirement 2463

### Configuration

| Field                                                   | Description                                                                |
|---------------------------------------------------------|----------------------------------------------------------------------------|
| Comma-separated list of Array SANtricity Controller IPs | IP addresses and/or fully-qualified domain names for the array controllers |

## Advanced configuration

| Field                                        | Description            |
|----------------------------------------------|------------------------|
| Inventory Poll Interval (min)                | Default is 30 minutes  |
| Performance Poll Interval up to 3600 seconds | Default is 300 seconds |

## Troubleshooting

Additional information on this data collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Configuring the NetApp HCI Management server data collector

The NetApp HCI Management server data collector collects NetApp HCI Host information and requires read-only privileges on all objects within the Management server.

This data collector acquires from the **NetApp HCI Management server only**. To collect data from the storage system, you must also configure the [NetApp SolidFire](#) data collector.

## Terminology

Cloud Insights acquires the following inventory information from this data collector. For each asset type acquired, the most common terminology used for the asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term  | Cloud Insights Term |
|--------------------|---------------------|
| Virtual disk       | Disk                |
| Host               | Host                |
| Virtual machine    | Virtual machine     |
| Data store         | Data store          |
| LUN                | Volume              |
| Fibre channel port | Port                |

These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

The following information is required to configure this data collector:

- IP address of the NetApp HCI Management server
- Read-only username and password for the NetApp HCI Management server
- Read only privileges on all objects in the NetApp HCI Management server.
- SDK access on the NetApp HCI Management server – normally already set up.
- Port requirements: http-80 https-443
- Validate access:

- Log into the NetApp HCI Management server using above username and password
- Verify SDK enabled: telnet <vc\_ip> 443

## Setup and connection

| Field            | Description                        |
|------------------|------------------------------------|
| Name             | Unique name for the data collector |
| Acquisition unit | Name of acquisition unit           |

## Configuration

| Field                             | Description                                               |
|-----------------------------------|-----------------------------------------------------------|
| NetApp HCI Storage Cluster MVIP   | Management Virtual IP Address                             |
| SolidFire Management Node (mNode) | Management Node IP Address                                |
| User name                         | User name used to access the NetApp HCI Management server |
| Password                          | Password used to access the NetApp HCI Management server  |
| VCenter User Name                 | User name for VCenter                                     |
| VCenter Password                  | Password for VCenter                                      |

## Advanced configuration

In the advanced configuration screen, check the **VM Performance** box to collect performance data. Inventory collection is enabled by default.

The following fields can be configured:

| Field                                           | Description                                                                                                                                               |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inventory poll interval (min)                   | Default is 20                                                                                                                                             |
| Filter VMs by                                   | Select CLUSTER, DATACENTER, or ESX HOST                                                                                                                   |
| Choose 'Exclude' or 'Include' to Specify a List | Specify Whether to Include or Exclude VMs                                                                                                                 |
| Filter Device List                              | List of VMs to filter (comma separated, or semicolon separated if comma is used in the value) for for Filtering by ESX_HOST, CLUSTER, and DATACENTER Only |
| Performance poll interval (sec)                 | Default is 300                                                                                                                                            |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| <b>Problem:</b>                                                          | <b>Try this:</b>                                                                                                                                                                                                                                                                                                                                                                                      |

## NetApp SolidFire All-Flash Array data collector

The NetApp SolidFire All-Flash Array data collector supports inventory and performance collection from both iSCSI and Fibre Channel SolidFire configurations.

The SolidFire data collector utilizes the SolidFire REST API. The acquisition unit where the data collector resides needs to be able to initiate HTTPS connections to TCP port 443 on the SolidFire cluster management IP address. The data collector needs credentials capable of making REST API queries on the SolidFire cluster.

### Terminology

Cloud Insights acquires the following inventory information from the NetApp SolidFire All-Flash Array data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| <b>Vendor/Model Term</b>            | <b>Cloud Insights Term</b> |
|-------------------------------------|----------------------------|
| Drive                               | Disk                       |
| Cluster                             | Storage                    |
| Node                                | Storage Node               |
| Volume                              | Volume                     |
| Fibre channel port                  | Port                       |
| Volume Access Group, LUN Assignment | Volume Map                 |
| iSCSI Session                       | Volume Mask                |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

The following are requirements for configuring this data collector:

- Management Virtual IP Address
- Read-only username and credentials
- Port 443

## Configuration

| Field                                | Description                                            |
|--------------------------------------|--------------------------------------------------------|
| Management Virtual IP Address (MVIP) | Management Virtual IP address of the SolidFire Cluster |
| User Name                            | Name used to log into the SolidFire cluster            |
| Password                             | Password used to log into the SolidFire cluster        |

## Advanced configuration

| Field                           | Description              |
|---------------------------------|--------------------------|
| Connection Type                 | Choose connection type   |
| Communication Port              | Port used for NetApp API |
| Inventory Poll Interval (min)   | Default is 20 minutes    |
| Performance Poll Interval (sec) | Default is 300 seconds   |

## Troubleshooting

When SolidFire reports an error it is displayed in Cloud Insights as follows:

*An error message was received from a SolidFire device while trying to retrieve data. The call was <method> (<parameterString> ). The error message from the device was (check the device manual): <message>*

Where:

- The <method> is an HTTP method, such as GET or PUT.
- The <parameterString> is a comma separated list of parameters that were included in the REST call.
- The <message> is whatever the device returned as the error message.

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## NetApp StorageGRID data collector

The NetApp StorageGRID data collector supports inventory and performance collection from StorageGRID configurations.

StorageGRID is metered at a different Raw TB to Managed Unit rate. Every 40 TB of unformatted StorageGRID capacity is charged as 1 [Managed Unit \(MU\)](#).

## Terminology

Cloud Insights acquires the following inventory information from the NetApp StorageGRID collector. For each asset type acquired, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| StorageGRID       | Storage             |
| Node              | Node                |
| Tenant            | Storage Pool        |
| Bucket            | Internal Volume     |

## Requirements

The following are requirements for configuring this data source:

- StorageGRID Host IP Address
- A username and password for a user that has had the Metric Query and Tenant Access roles assigned
- Port 443

## Configuration

| Field                       | Description                                                |
|-----------------------------|------------------------------------------------------------|
| StorageGRID Host IP Address | Management Virtual IP address of the StorageGRID appliance |
| User Name                   | Name used to log into the StorageGRID appliance            |
| Password                    | Password used to log into the StorageGRID appliance        |

## Advanced configuration

| Field                           | Description            |
|---------------------------------|------------------------|
| Inventory Poll Interval (min)   | Default is 60 minutes  |
| performance Poll Interval (sec) | Default is 900 seconds |

## Single Sign-On (SSO)

The [StorageGRID](#) firmware versions have corresponding API versions; 3.0 API and newer versions support single sign-on (SSO) login.

| Firmware version | API version | Support single sign on (SSO) |
|------------------|-------------|------------------------------|
| 11.1             | 2           | No                           |

|      |     |     |
|------|-----|-----|
| 11.2 | 3.0 | Yes |
| 11.5 | 3.3 | Yes |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## Nutanix NX data collector

Cloud Insights uses the Nutanix data collector to discover inventory and performance data for Nutanix NX storage systems.

## Terminology

Cloud Insights acquires the following inventory information from the Nutanix data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Storage Pool      | Storage Pool        |
| Nutanix Container | Internal Volume     |
| Nutanix Container | File Share          |
| NFS Share         | Share               |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- The external data services IP address for the cluster
- Read-only user name and password, unless volume\_groups are in use, in which case, Admin user name and password are required
- Port requirement: HTTPS 443

## Configuration

| Field                     | Description                                           |
|---------------------------|-------------------------------------------------------|
| Prism External IP Address | The external data services IP address for the cluster |
| User name                 | User name for the Admin account                       |
| Password                  | Password for the Admin account                        |

## Advanced configuration

| Field                          | Description                                                     |
|--------------------------------|-----------------------------------------------------------------|
| TCP port                       | TCP Port used to connect to Nutanix array. The default is 9440. |
| Inventory poll interval (min)  | Interval between inventory polls. The default is 60 minutes.    |
| Performance poll interval(sec) | Interval between performance polls. The default is 300 seconds. |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

## OpenStack data collector

The OpenStack (REST API / KVM) data collector acquires inventory data for all OpenStack instances, and optionally, VM performance data.

### Requirements

- IP address of the OpenStack controller
- OpenStack admin role credential and sudo access to the Linux KVM hypervisor. If you are not using the admin account or admin equivalent privileges, you will need to use trial and error to identify the default policies to relax for your data collector userid.
- The OpenStack Ceilometer module must be installed and configured for performance collection. Configuring the Ceilometer is done by editing the nova.conf file for each hypervisor and then restarting the Nova Compute service on each hypervisor. The option name changes for different releases of OpenStack:
  - Icehouse
  - Juno
  - Kilo
  - Liberty
  - Mitaka
  - Newton
  - Ocata
- For CPU stats, “compute\_monitors=ComputeDriverCPUMonitor” needs to be turned on in /etc/nova/nova.conf on compute nodes.
- Port requirements:
  - 5000 for http and 13000 for https, for the Keystone service
  - 22 for KVM SSH
  - 8774 for Nova Compute Service
  - 8776 for Cinder Block Service
  - 8777 for Ceilometer Performance Service

- 9292 for Glance Image Service

**Note** The port binds to the specific service, and the service may run on the controller or another host in larger environments.

## Configuration

| Field                                                              | Description                                                           |
|--------------------------------------------------------------------|-----------------------------------------------------------------------|
| OpenStack Controller IP Address                                    | IP address or fully-qualified domain name of the OpenStack Controller |
| OpenStack Administrator                                            | User name for an OpenStack Admin                                      |
| OpenStack Password                                                 | Password used for the OpenStack Admin                                 |
| OpenStack Administrator Tenant                                     | OpenStack Administrator Tenant name                                   |
| KVM Sudo User                                                      | KVM Sudo User name                                                    |
| Choose 'Password' or 'OpenSSH Key File' to specify credential type | Credential type used to connect to the device via SSH                 |
| Full Path to Inventory Private Key                                 | Full Path to Inventory Private Key                                    |
| KVM Sudo Password                                                  | KVM Sudo Password                                                     |

## Advanced configuration

| Field                                             | Description                                                     |
|---------------------------------------------------|-----------------------------------------------------------------|
| Enable hypervisor inventory discovery through SSH | Check this to enable hypervisor inventory discovery through SSH |
| OpenStack Admin URL port                          | OpenStack Admin URL port                                        |
| Use HTTPS                                         | Check to use secure HTTP                                        |
| SSH Port                                          | Port used for SSH                                               |
| SSH Process Retries                               | Number of inventory retry attempts                              |
| Inventory Poll Interval (min)                     | Interval between inventory polls. The default is 20 minutes.    |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                                | Try this:                                                                                                    |

# Oracle ZFS Storage Appliance data collector

Cloud Insights uses the Oracle ZFS Storage Appliance data collector to gather inventory and performance data.

## Terminology

Cloud Insights acquires inventory information with the Oracle ZFS data collector. For each asset type acquired by Cloud Insights, the most common terminology used for this asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Disk (SSD)        | Disk                |
| Cluster           | Storage             |
| Controller        | Storage Node        |
| LUN               | Volume              |
| LUN Map           | Volume Map          |
| Initiator,Target  | Volume Mask         |
| Share             | Internal Volume     |

Note: These are common terminology mappings only and might not represent every case for this data source.

## Requirements

- Host names for the ZFS Controller-1 and the ZFS Controller-2
- Administrator user name and password
- Port requirement: 215 HTTP/HTTPS

## Required Performance metrics

Oracle ZFS appliances give storage administrators large amounts of flexibility to capture performance statistics. Cloud Insights expects you to have *each* controller in a high availability pair configured to capture the following metrics:

- smb2.ops[share]
- nfs3.ops[share]
- nfs4.ops[share]
- nfs4-1.ops[share]

Failure to have the controller capture any or all of these will likely result in Cloud Insights not having, or underreporting, the workload on the "Internal Volumes".

## Configuration

| Field                     | Description                                                 |
|---------------------------|-------------------------------------------------------------|
| ZFS Controller-1 Hostname | Host name for storage controller 1                          |
| ZFS Controller-2 Hostname | Host name for storage controller 2                          |
| User name                 | User name for the storage system administrator user account |
| Password                  | Password for the administrator user account                 |

## Advanced configuration

| Field                           | Description                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------|
| Connection Type                 | HTTPS or HTTP, also displays the default port                                                           |
| Override Connection Port        | If blank, use the default port in the Connection Type field, otherwise enter the connection port to use |
| Inventory poll interval         | The default is 60 seconds                                                                               |
| Performance Poll Interval (sec) | The default is 300.                                                                                     |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                  | Try this:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# Pure Storage FlashArray data collector

Cloud Insights uses the Pure Storage FlashArray data collector to gather inventory and performance data.

## Terminology

For each asset type acquired by Cloud Insights, the most common terminology used for the asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Drive (SSD)       | Disk                |
| Array             | Storage             |
| Controller        | Storage Node        |
| Volume            | Volume              |
| LUN Map           | Volume Map          |
| Initiator, Target | Volume Mask         |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- Storage system IP address
- User name and password for the Administrator account of the Pure storage system.
- Port requirement: HTTP/HTTPS 80/443

## Configuration

| Field                                     | Description                      |
|-------------------------------------------|----------------------------------|
| FlashArray Host IP Address                | IP address of the storage system |
| User name                                 | User name with admin privileges  |
| Password for the admin privileged account | Password                         |

## Advanced configuration

| Field                         | Description                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------|
| Connection type               | Choose HTTP or HTTPS. Also displays the default port.                                                   |
| Override TCP port             | If blank, use the default port in the Connection Type field, otherwise enter the connection port to use |
| Inventory poll interval (min) | The default is 60 minutes                                                                               |

| Field                           | Description        |
|---------------------------------|--------------------|
| Performance Poll Interval (sec) | The default is 300 |

## Troubleshooting

Some things to try if you encounter problems with this data collector:

### Inventory

| Problem:                                                                                           | Try this:                                                       |
|----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| "Invalid login credentials" with error messages "Policy doesn't allow" or "You are not authorized" | Validate Pure user account and password via Pure http interface |

## Red Hat Virtualization data collector

Cloud Insights uses the Red Hat Virtualization data collector to gather inventory data from virtualized Linux and Microsoft Windows workloads.

## Terminology

For each asset type acquired by Cloud Insights, the most common terminology used for the asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term | Cloud Insights Term |
|-------------------|---------------------|
| Disk              | Virtual Disk        |
| Host              | Host                |
| Virtual Machine   | Virtual Machine     |
| Storage Domain    | Data Store          |
| Logical Unit      | LUN                 |

Note: These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

- IP address of the RHEV server over port 443 via REST API
- Read-only username and password
- RHEV Version 3.0+

## Configuration

| Field                                     | Description                      |
|-------------------------------------------|----------------------------------|
| RHEV Server IP Address                    | IP address of the storage system |
| User name                                 | User name with admin privileges  |
| Password for the admin privileged account | Password                         |

## Advanced configuration

| Field                         | Description                               |
|-------------------------------|-------------------------------------------|
| HTTPS Communication Port      | Port used for HTTPS communication to RHEV |
| Inventory poll interval (min) | The default is 20 minutes.                |

## Troubleshooting

Additional information on this Data Collector may be found from the [Support](#) page or in the [Data Collector Support Matrix](#).

# Configuring the VMware vSphere data collector

The data collector for VMware vSphere collects ESX Host information and requires read-only privileges on all objects within the Virtual Center.

## Terminology

Cloud Insights acquires the following inventory information from the VMware vSphere data collector. For each asset type acquired, the most common terminology used for the asset is shown. When viewing or troubleshooting this data collector, keep the following terminology in mind:

| Vendor/Model Term  | Cloud Insights Term |
|--------------------|---------------------|
| Virtual disk       | Disk                |
| Host               | Host                |
| Virtual machine    | Virtual machine     |
| Data store         | Data store          |
| LUN                | Volume              |
| Fibre channel port | Port                |

These are common terminology mappings only and might not represent every case for this data collector.

## Requirements

The following information is required to configure this data collector:

- IP address of the Virtual Center server
- Read-only username and password in Virtual Center

- We require read only privileges on all objects within Virtual Center.
- SDK access on the Virtual Center server – normally already setup.
- Port requirements: http-80 https-443
- Validate access:
  - Log into Virtual Center Client using above username and password
  - Verify SDK enabled: telnet <vc\_ip> 443

## Setup and connection

| Field            | Description                        |
|------------------|------------------------------------|
| Name             | Unique name for the data collector |
| Acquisition unit | Name of acquisition unit           |

## Configuration

| Field                     | Description                                 |
|---------------------------|---------------------------------------------|
| Virtual center IP Address | IP address of the Virtual Center            |
| User name                 | User name used to access the Virtual Center |
| Password                  | Password used to access the Virtual Center  |

## Advanced configuration

In the advanced configuration screen, check the **VM Performance** box to collect performance data. Inventory collection is enabled by default.

The following fields can be configured:

| Field                                           | Description                                                 |
|-------------------------------------------------|-------------------------------------------------------------|
| Inventory poll interval (min)                   | Default is 20                                               |
| Filter VMs                                      | Select CLUSTER, DATACENTER, or ESX HOST                     |
| Choose 'Exclude' or 'Include' to Specify a List | Create a filter list (CLUSTER, DATACENTER, and/or ESX_HOST) |
| Number of retries                               | Default is 3                                                |
| Communication port                              | Default is 443                                              |

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter Device List...           | <p>This list must consist of exact string matches - if you intend to filter by ESX_HOST, you must build a comma delimited list of the exact "names" of your ESX hosts as reported in both Cloud Insights and vSphere. These "names" may be either IP addresses, simple hostnames, or fully qualified domain names (FQDNs) - this is determined by how these hosts were named when they were originally added to vSphere.</p> <p>When filtering by CLUSTER, use the Cloud Insights-style cluster names as reported by CI on hypervisors - Cloud Insights prepends the vSphere cluster name with the vSphere datacenter name and a forward slash - "DC1/clusterA" is the cluster name Cloud Insights would report on a hypervisor in clusterA within data center DC1.</p> |
| Performance poll interval (sec) | Default is 300                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
